INTRODUCTION
ON THE ENJOYMENT OF SCULPTURE

INTRODUCTION

ON THE ENJOYMENT OF SCULPTURE

WHEN the work of art, in becoming historic fact, has ceased to be æsthetic fact, we are, in our dealings with it, justified in making the outer eye play the part of catpaw for the inner eye, in making the sense of sight minister to our "literary" and scientific rather than to our æsthetic enjoyment. When, however, the work of art remains æsthetic fact, that is, when there can be gained from it data of observation which are so tinged with a certain sense pleasure that they are thereby distinguished from data gained through the action of any other sense or by any purely mental operation, then we are in common sense bound to regard such æsthetic data as the primary, because peculiar, values of that work of art. And such other values as exist for us in a work of art (and there are many, both suggestive and scientific) will be properly regarded as secondary values, since they may be obtained from other objects, and, wherever obtained, take the same place in our favorite

mental operations. For instance, the historian and the philosopher may value the data gained from ancient art exactly as they value the data gained from ancient writers, and may work both into their schemes of things on the same terms. The scientist may classify Greek marbles as dispassionately as he would beetles, and presumably obtain in both instances the same intellectual pleasure. The man who prefers to use his data of observation imaginatively, be he dreamer or writer, may find in the work of art the same suggestions for his fancy that he finds in music, in natural objects, in the spoken word.

It follows, then, that to fail to obtain the primary values of a work of art is to defraud oneself of enjoyment as truly as if one valued an orchid only for its rarity, or went to the opera merely for the sake of seeing the costumes. Unless the architect who studies Brunelleschi's dome feels the unique beauty of its wonderful curve, unless the archæologist who dates a Greek vase is in some degree teased out of thought by its loveliness of form, unless the poet, to whom Botticelli's *Spring* is a Lucretian allegory of the seasons, sees and feels the pattern of line intertwining with line, he is as blind to primary values as were the Roman peasants who made a quarry of the Forum, and burned antique marbles to procure the lime for their wretched huts. Although he has made

art serve his ends, he has refused a gift to be obtained nowhere else, the pleasure offered to his sense of sight. He could have exercised the same faculties in the same way on other material. Fool and blind, he has overlooked the primary value of a work of art, the power to give him a pleasure determined by the special sense to which it appeals.

That each art gives its peculiar pleasure, conditioned by the sense to which it appeals, is self-evident to anybody who takes the trouble to analyze his sensations. We speak of "harmonies" of color, "picturesque" sculpture and music, showing, in our very borrowing of adjectives, that we make a distinction in our sensations. A scrupulosity in marking this distinction is the first step toward enlarging our individual field of æsthetic pleasure, and as our concern here is with our enjoyment of sculpture, we must analyze the sensations given by objects of three dimensions through the sense of sight.

Now such an analysis in its scientifically exact form is to be found in the psychologic text-books, where it is too often so elaborated that it requires a special education to understand its terminology. It convinces our reason that our recognition of form by sight is based upon our sense of touch, that from our ancestors and our own infancy we have inherited the power of instantaneously identifying sight symbols

with the results of touch experience, so that at bottom our sensations of form are sensations of touch, and it has traced for us the processes by which we gained this power back through the mazes of our own infancy and that of the race. For a personal realization of the truth of this theory and of the nature of those far-away processes, a little actual modelling is more enlightening than a study of treatises. Suppose one is modelling some small object in clay from a plaster cast. The sensations of depression and projection which his hand gets as he moulds the clay continually change as he endeavors to reach a combination of planes which will reflect the light in the same way that his cast does, that is, which will give the same signals to his eye. He begins to understand then, as he pushes the clay up for a high light and makes hollows for shadows, that gradations of light mean gradations of plane, mean sensations of touch of the hand. As for the more involved sensations of body, which the psychologist includes in the sensation of touch, the process by which they are translated into terms of sight is analogous to the sculptor's experience in modelling a figure. As he works, he feels, beside the sensations of objective touch, the bodily sensations appropriate to the state and action of the object he is making. He tests the relations of parts by his own sensations, by translating strain, relaxation,

pressure, etc., into sight terms. The sculptor's experience may hint to us of the way in which in our mysterious psychic past we learned to recognize form by sight. In the present the sight symbols are first in our consciousness, and their connection with touch sensations is apparent to us only in this fact, that they seem to produce in consciousness imagined sensations which are copies of the originals. Such imagined sensations, it goes without saying, vary in intensity according to temperament and training. When the sculptor looks at an object, the light and shade which meet his eye speak to his hand, which feels in fancy the very sensations of modelling. When he looks at a figure, he tests by the imagined sensations of his body the symbols of strain, relaxation, etc. Now the imagined touch sensations, which, for the sculptor, follow so definitely upon sight, are in kind the same that the rest of the world feels in a fumbling, confused way, and which, according to their character, determine our æsthetic pleasure in form.

For if, as an object of three dimensions, the piece of sculpture rouses in us imagined sensations, as an art object its function is to make those sensations the pleasantest possible, to give them a more enjoyable quality than could the natural object which it represents. How is this brought about? We know that we take pleasure in the recognition of objects, and

that there are certain qualities of form which give us pleasure. Now in a statue the sculptor aims to disentangle the important elements from the superfluous so that our recognition is quicker, and therefore pleasanter, than it is in the case of a natural object. Moreover, he presents to us in his synthesis, not only a synthesis of the significant elements, but a synthesis of those elements which are of the most beauty. For instance, compare the difference in the pleasant effect of a photograph and a portrait. If the artist's synthesis is a good one, we shall notice that our recognition of the person is quicker and more pleasant in the case of the portrait than in that of the photograph, because the artist's mind has selected, whereas the lens has caught every detail without emphasis of the important, or the most attractive. Moreover, in being able to select the elements of his synthesis, the artist is able to give us sensations experienced under ideal conditions, sensations which are not accompanied by the fatigue of bodily waste, and which are of larger scope than we could of ourselves imagine. Should I ever be able to feel for myself in reality the muscular sensations which become mine in imagination when I identify myself with the Discobolus? I enjoy the pleasure of perfect human action without any of the physical waste. If I look at the Shaw Monument, I can extract the pleasure of rhythmic, concerted movement without

feeling any of the discomfort attendant upon actual marching. I may even exceed the normal experience of the body, and possess, as I look at the Fates of the Parthenon, the imagined physical potentialities of the gods.

Besides creating ideal conditions, the artist's synthesis is in addition more pleasurable to us than is the natural object, because it is permanent, and consequently we can both accumulate imagined sensations through contemplation, and can examine them as our mood suggests. In an analytical examination, it is clear enough that such sensations are the true progenitors of emotions and ideas which we consider properly æsthetic, since they are shaped and tinged from their source. Their stir in the mind is practically coincident with that of the imagined sensations which determine their character and extent. Recognition of an object seems to start many mental vibrations, but, as such recognition is inextricably dependent upon the actual touch sensations which have preceded it, and the imagined ones which follow, it is really those sensations which set agog all that psychic region of ideas and emotions which can be properly termed æsthetic, in distinction from those aroused by other stimuli. While, in theory, such directly æsthetic ideas and emotions can be separated from those induced by non-sense stimuli, in practice, the law of association of

ideas operates to make their isolation extremely difficult, and doubtless affects their quality. Sometimes by continuing them in pleasant channels, it prolongs their life, and gives us an extension of æsthetic pleasure. For instance, the directly æsthetic feelings aroused by a medallion of a mother and child are the fruit of our recognition of the differences in imagined sensation given by the two figures and of the relations between them. But we are accustomed to associate with that relation a network of feelings which continue the directly æsthetic feelings, and make a pleasant irradiation of emotion. Sometimes, by checking the directly æsthetic feeling by some irrelevancy, the association of ideas causes the intrusion of pain. There is in Rome a colossal statue of the infant Hercules. The sense impression of colossal proportions becomes painful when confronted with our associations of the tender helplessness of childhood. Often the ideas associated with material are at variance with the ideas of its form. The white marble sunbonnets, lace collars, and netted jerseys in which the modern Italian workman dresses his statues are disagreeably at variance with the ideas of texture, flexibility, etc., which we associate with sunbonnets and collars and jerseys.

Most indirect of all associations, and most often the farthest removed from our sensations, are the ideas and emotions aroused by the expression of a subject

in words. The real subject is our recognition based upon our sensations. The real subject sometimes coincides perfectly with the expressed subject, sometimes coincides partly, sometimes coincides not at all. The degree of its coincidence affects the flow of our æsthetic ideas and emotions, and therefore indirectly affects our æsthetic pleasure. In perfect art, words are unnecessary, or merely afford the intellectual satisfaction of expressing one's thoughts in words. Whether the Theseus of the Parthenon be called Theseus or Mt. Olympus it has the same æsthetic meaning to me, for my sensations are so adequately evocative of ideas and emotions that definition by words adds practically nothing. In Rodin's War, the naming of the figure merely brings to the focus of a spoken word those ideas and emotions that my sensations have already induced. In less perfect art, the spoken subject counts for more. It adds or detracts. Both possibilities are illustrated by the Prudence of Paul III's tomb in St. Peter's. Under the figure of the Pope reclines the half draped figure of a woman whose attitude and bodily form are replete with voluptuous suggestion. As an allegorical embodiment of the virtue Prudence it is ugly to me because of the shock between the real subject as recognized by my sensations and the ideas associated with the expressed subject. When however I find that the figure is a

portrait of the mistress of Pope Paul III the shock is removed, and the figure and the subject reënforce each other.

Considering the relativity of the æsthetic field consequent upon varying individual sensibility and association of ideas, it becomes but too clear that we cannot say with certainty where the æsthetic enjoyment of any work of sculpture melts into that adumbration of emotions and ideas which may be only indirectly connected with our imagined touch sensations. For each temperament there will be a different standard of æsthetic value. That it shall be really æsthetic is the main necessity. It will be such if we demand that the work of sculpture shall meet two conditions. It shall produce pleasant imagined sensations which are unlike those obtained from any other source, and they shall be evocative of emotions and ideas which are felt to be in accord with them and with one another.

The three great periods of sculpture, the Greek of the fifth century, B.C., the mediæval of the thirteenth, and the Renaissance of the fifteenth have met the æsthetic demand in different ways. It is because Greek sculpture meets most perfectly the two conditions stated that we call it the greatest sculpture. "That is the best art which best expresses the thing it can best express," which gives the especial æsthetic pleasure

pertaining to it in purest form. How did the Greek meet the first requirement, that is, what means did he employ which can give the pleasantest possible sensations? In the first place he chose the human figure, preferably the nude, which is the object best able to give the most intense imagined sensations. He modelled it in broad planes, subtly flattened, so that the eye quickly and easily grasps the essentials. Under Greek conditions of physical life he had the nude figure constantly before his eyes in the gymnasia and the games. He therefore knew the appearance to the eye of every part of the symmetrically developed body in every posture of action. Such education of the eye has never been possible since in any other civilization. The modern sculptor knows his anatomy from dissection; the Greek probably knew only the look of the muscles, etc., from the outside. The modern sculptor, relying more upon his knowledge than upon the eye, builds up his figure on a wooden core by laying muscle on muscle, tendon on tendon. Strangely enough he gains by this exact method no greater appearance of reality, and the eye is tired by the details thrust upon it, details which it would never see for itself, but which the sculptor represents because he knows from his anatomy that they are there. Not only is the synthesis of the Greek a composition of the elements most significant in recognition, but it is

as well a composition of elements which we call most beautiful because experience has shown us that they are most pleasant. The union of the most significant and the most pleasant sensations gives us the rarest, the most complete and most delightful of imagined sensations, namely, that of perfect physical self-possession. Actual life furnishes only broken hints of such a sensation, just enough to make the imagination leap to meet the ideal of Greek sculpture, which as sculpture not only induces the imagined sensation of perfect human self-possession of body, but, by representing the gods as magnified humanity, raises that sensation to divine power, and makes real to us the apotheosis of all physical potentialities.

The accompanying ideas and emotions seem included in a corresponding mental self-possession, which is not that obtained by the mastery of one part of the nature by another, that conquest of flesh by spirit suggested by the Christian art, but is a state simultaneous with the physical, and in perfect accord. So well known to us are those maxims of the Greeks which express their racial thought, that we are glib enough in translating our ideas into such words as "definiteness," "repose," "serenity," "ideality," etc. Had we never heard, however, of the "characteristics of the Greek Spirit," Greek sculpture would still have been able to give us direct notions of an intellectual

steadiness, a moral balance, and a spiritual serenity, illustrating perfect self-possession of body and soul, the "*mens sana in corpore sano*."

As a word from time to time changes its value in the vocabulary of a people, so an art from one age to another changes its value as a means of expression. Sculpture was for the Greeks the art-word expressing their deepest views about life. For the Middle Ages the expressive word was architecture, and sculpture became the explanatory adjective. Therefore, the monumental sculpture of the Middle Ages is best considered in relation to the architecture which determined its character.

In looking at the cathedral statues, the eye repeats in miniature the motions that it makes in going over the architecture. Our sensations, then, are practically those which architecture rather than sculpture gives, that is, the sensations of adjusted weight and of pressure and of the balance of related masses, a set of feelings pleasant but less invigorating than those produced by detached figures whose proportions are human. So far, then, as our ideas and emotions follow directly on imagined sensations, they will be those connected with the qualities of dignity, strength, saintly simplicity and power, as contrasted with demonic distortion. But in this sculpture mediæval Christianity meant to embody its complex theology and its mystic senti-

ments. Such an aim was doomed to defeat. The stones could never be other than crude symbols of spiritual things, symbols which had perhaps to the mediæval peoples wide associations, theological and mystical, but which, to the ordinary observer of to-day, are merely symbols of a state of mind of past ages. When this great cathedral sculpture chooses, in its more plastic moments, the bodying forth of determinate conceptions in the illustration of Scripture incident and character, its æsthetic appeal is direct and strong within limitations. It has to be said, however, that, taken as a whole, the interest of this sculpture is greater than its æsthetic appeal, the working out of its meaning and moral more engrossing than its sense appeal. Its value as æsthetic fact is for most people swallowed up by its value as historic fact, for its field of association is so wide and so interesting that one naturally becomes symbolist or scientist, and leaves sensation far behind.

The early Renaissance inherited religious feeling from the Middle Ages, and since sculpture of the fourteenth and fifteenth centuries is destined for church and shrine, its formal subjects are religious, but, unlike those of the preceding centuries, they are not theological. The classic revival and the awakening to nature leads it to throw off the incubus of dogma and of gloomy intricacy of feeling, and to

choose the more definite aspects and clearer sentiments which are capable of representation in art. As in Italian architecture, the Gothic, true growth of the North, had never been other than a graft upon the classic tradition, rooted and grounded in the soil, so the subtleties and dark extremities of mediæval faith had never fully possessed a people whose senses awoke at the first breath of the classic revival.

Their formal subjects, then, are those incidents and sentiments of Bible story which form, as it were, the lyric matter of Christian poetry, and which, therefore, are in accord with and radiate from their direct subjects, which are the poetic threads of the fabric of thought, since they concern the innocence of childhood, the chastity of delicate womanhood, the spirit of youth, the dignity of maturity, and the repose of death. Unable to grasp a whole design wherein each thread has its proportionate part, they seize now this thread, now that, and work it in with common stuff. For their newly awakened senses were incapable of seeing form steadily and seeing it whole, but were intoxicated by this or that fragment of beauty. Their sculpture, then, cannot give us an imagined sensation, like that of the Greek, of a perfect physical self-possession which includes all special sensations, but our imagined sensations are localized and specialized, made ecstatic by emphasis and contrast with the common, so that

there is more variation of physical mood possible than in Greek sculpture. It differs most from the Greek by inducing a set of imagined touch sensations rarely reported by healthy nerves. These are sensations largely dependent upon the working of the material. Let one who is familiar with originals of both Renaissance and of Greek art compare their respective casts in a museum. He will realize this, that although the Greek cast echoes but feebly the sensations given by the original, yet that echo comes nearer to duplicating the sensations that the original gave, than the Renaissance cast can come to duplicating the sensations that its original gave. The reason is this: that in the Greek, the form, aside from the material and the workmanship of the marble, is the essential to which all else is subordinated; in the Renaissance a good half of our enjoyment depends upon the material, upon its surface treatment, its color, its polish. So great has been the sculptor's longing for beauty that, although in the cramped physical life of the Middle Ages his eyes have never beheld nor his heart conceived the perfect forms of Greek life, and he has but caught fragments of beauty, a forehead, or a mouth, or a hand, and has set them inadequately, yet, out of his longing for beauty, he has lavished toil upon the details, working the marble as if it were wax, aiming at a subtle play of light and shade over its surface,

and has invented a new melody of sight to entrance the eye. And so strongly is his own desire of beauty thereby reflected to us, that we too ache for beauty. Certain delicate sensations of touch which it suggests, as the passing of the finger-tips over subtly modelled surfaces, the fall of eyelids on the cheek, and others as inexpressible in words, give pleasure as poignant as that which comes with the sudden perfumes wafted over Tuscan hedges in spring, and attends the lingering afterglow of clear yellow sunsets hung behind the purple curves of Tuscan hills.

PART I

THE EARLY RENAISSANCE

CHAPTER I

THE CHARACTERISTICS OF THE EARLY RENAISSANCE

CHAPTER I

THE CHARACTERISTICS OF THE EARLY RENAISSANCE

(1400-1500)

So subtle is the æsthetic appeal of Renaissance sculpture, so varied and delicate are the imagined sensations induced, and so gently do the emotions and ideas which they arouse melt into the atmosphere of poetry which the word "Renaissance" carries with it, that it is a difficult matter to isolate the purely æsthetic element of the general poetic appeal. To think and to feel without words is direct æsthetic enjoyment. When, however, we attempt to define our enjoyment in words, we think that we realize better our attitude toward the art object if we understand how that object came to be "as in itself it really is." In other words, if we can logically see how the general characteristics of any historical period show themselves as formative influences in the art of that period, we add to our field of association many ideas which seem to cast light on our æsthetic enjoyment.

Behind all the visible manifestations of the human spirit during the Renaissance was the unexplainable awakening of spiritual energy. Of the observable causes accelerating onward movement, the enthusiasm for Antiquity and the enthusiasm for Nature are the most clearly marked.

In art these are the discovered headwaters, the two tributary sources, which, under general Renaissance influences, send down the dry bed of mediæval art a spring flood whose great wave changes the face of the country through which it passes, and which, despite diminishing force, rolls in turn through every nation of Western Europe. How did these two tributaries show themselves in the general current? Let us consider first the enthusiasm for Antiquity, an influence so prominent in all Renaissance activity that to early historians it suggested the figurative name of "re-birth." In the Early Renaissance, the influence of Antiquity upon art was indirect; that is, it resulted in inspiration rather than in imitation. It was communicated through the Latin classics. The painter or sculptor or jeweller may have owned and read for himself his Cicero or his Lucretius or his translation of Plato. But, even if his contact with the classics were not at first hand through his own study, he was in the way of frequently hearing the Latin worthies read and commented upon by the scholars who owned the same patron as himself. He

was one of the company who sat at table with his princely patron, and, while his eyes wandered over the rich colors of vaulted ceiling and frescoed walls, or perhaps fastened upon some fragment of antique marble recently acquired and proudly displayed, his ears were hearing dissertations on the lives and ideals of the ancient Romans by the most noted humanists of the day. Or in Lorenzo's villa at Fiesole he listens to the discussion of Aristotle's idea of beauty, while his eyes drink in the clear distance-color of Tuscan landscape, and the lovely curves and modelling of Tuscan hills. Therefore, when he draws his subject from classic story, as did Botticelli in his *Birth of Venus*, he conceives it in a romantic spirit as far removed from the classic, as is the physically complacent *Venus de' Medici* from that pale wistful goddess of Botticelli, who resembles her prototype only in name and an echo of pose. Perhaps he had studied Antiquity in Rome itself with the ardor of Brunelleschi or of the young Donatello. Afterward he draws upon his sketch-book for classic motifs of decoration, but he works those motifs into his own original ornamental schemes, untrammelled by classic treatment and tradition. Even when he is most strenuously endeavoring to work in the classic manner, as is plainly the case with Donatello in his *David of the Bargello*, he has not made a conglomeration of bodily forms from fragments of the antique that have

come to his notice, but, stopping far short of imitation, he has tried to imbue the statue with certain classic qualities, as he understood them, and has secured the life of his statue by working from a living model.

Perhaps, like Ghiberti, he was an enthusiastic collector of antique marbles, with so keen an appreciation of their beauties as to say that "the touch only can discover its beauties which escape the sense of sight in any light." But unmistakable as is the classic influence in the grace and suavity of Ghiberti's Baptistery gates, there is no direct imitation there. The copper of the bronze is not more inseparably fused with the other elements of the compound than is the classic with the Gothic and the individual, to make the unique beauty of the wonderful doors.

Ghiberti's willingness to spend over a score of years in combining various elements of beauty illustrates the truest and deepest influence of the Antique upon the sculptors of the Early Renaissance. They were not yet learned enough to reduce classic art to a set of formulæ, nor did they comprehend its conventions, its ideals, or its spirit. But their brooding enthusiasm for its imagined beauties kindles a passion for beauty, for all beauty, which burns out of their work the stupidities of tradition and the grossness of insensibility. The reflex of this spirit upon us makes much of the charm of the minor sculptors. Lacking the intensity of such

genius as Ghiberti's, which could strike out into definite forms its visions of loveliness, the minor masters are yet agitated by that desire of beauty which pervades the artistic atmosphere. Not a bit of sculptured ornament, nor a relief, not a bust but shows in its careful planning, its conscientious cutting, and its painstaking finish, its maker's longing to make the work of his hands a thing of beauty. It is, moreover, this keen desire of beauty which discovered and made possible in sculpture certain rare and delicate appeals, as the exquisite structure of the hands, and of the emaciated faces of old men, the curves of girlish foreheads, and the folds of women's eyelids.

Such being the deepest influence of the enthusiasm for Antiquity, it is to it rather than to the enthusiasm for Nature that the æsthetic character of Early Renaissance sculpture is due. The latter influence is the greatest evolutionary force, and determines the progression of the art. The sculptors labor steadily, even joyfully, upon those problems which concern the representation of visual facts, problems of anatomy, of human proportions, and of the technique of material, and their success in solving them accounts not only for the steady evolution of sculpture as compared with the more fluctuating course of painting, but also determines the short life of sculpture, which, like some natural organism developing under the most favorable

conditions, was thus enabled to proceed with no hindrances through the processes of growth, culmination, and decay. So orderly is its movement and so natural is its rise and fall, that we divide the semicircle of its course into two arcs called the "Early" and the "Late" Renaissance, which are distinguished from each other in spirit, subject, and technique.

Most apt is the application of the adjective "youthful" to the spirit of the Early Renaissance in all of its phases and manifestations. As regards sculpture, in freshness of feeling, in naïve representation of what attracts it, in satisfaction with the beauty that strikes the sense, void of any evidences of struggle to express a deep spiritual significance, its spirit is truly youthful. Its high estimate of its own productions, even while it vaunted those of Antiquity, implies a confidence in its own taste and a disposition to be a law unto itself, which, while it is also youthful, is yet the natural safeguard of the artist spirit in any period. Its two crowning qualities, however, are those which, alas, are too rarely the endowment either of the artist or of youth, namely, its intellectuality and its emotional sensibility. It had the willingness to think; it had the capacity for sentiment. It was intellectual and it was also poetic. Has the possession and exercise of brain ever been more strikingly shown in art than in those two splendid equestrian statues, the Gattamelata and

the Colleoni which, in composition, grasp of character, and mastery of material, have hardly been equalled in modern times, and have surely never been surpassed? Or could certain sentiments be more poetically expressed? — that feeling for the dead, for instance, which is the theme of Renaissance tombs? Could any elegy better voice the Christian's thought of the dead, as of those who rest from this life and await that which is to come, than that figure of the young Cardinal of Portugal lying on his tomb in San Miniato, the frailty of the physical pathetically suggested by the wasted face and hands, the surety of the spiritual by the essential dignity of the lifeless body that was once its tenement?

This poetic spirit finds itself in happy harmony with the subjects that sculpture was called upon to treat. Art is still the handmaid of religion; but as if both are conscious that separation is near at hand, they accommodate their positions to each other, the one satisfied with such Ariel service as the other is eager to give. Sculpture is not compelled, as in earlier times, to the hopeless task of embodying in stone the mysteries and terrors of the Last Judgment, nor, mutinying against religion, as in later days, does it pretend to serve, calling by the names of saints and virtues, statues, which in voluptuous appeal minister to the flesh, not to the spirit. It is at one with the church

in the possession of a kind of religious sentiment which its genius is admirably fitted to express. By preference the sculptor pays his devotions to the Madonna and to some few favorite patron saints. He establishes them in their shrines with all due reverence, but, led by his naturalistic instinct to give them the forms and features which charm his eye in the actual world that he knows, he thereby seems to bring them within the palpable reach of human affection, into a relation of friendly neighborliness. In its reliefs sculpture treats again and again simple incidents in scriptural narrative and in the lives of the saints, feeling no apparent weariness in telling over and over stories which it still wholly loves, and doubtless more than half believes. Its free statues are those of saints or prophets, holy characters, but actual men notwithstanding; Zachariah, with bald head, beloved St. Bernard, toothless, but with kindly eyes.

In its secular subjects, its intellectuality finds larger scope in its portraits, which, few in number as compared with collections of ancient and modern busts, are yet the masterpieces of the world. The Egyptian attained actual imitation of human features; the Roman succeeded in representing the man, but the Renaissance did more than either, for it comprehended and expressed the character, and yet made the outer presentment of the man an object beautiful in itself.

This habit of prizing the æsthetic possibilities of the portrait appears fully developed in the tombs, where the effigy of the man is framed, as it were, in an elaborate composition of decorative surfaces, of which the face and hands form the keynote of color, the dominant value in the scale of light and shade which compose the ordered and melodious whole.

The examination of any one tomb of the Early Renaissance gives us an idea of the technique of all the marble workers. There they show themselves masters of the harmonies of light and shade, and display their skill in combining every value of figure, relief, and texture in panels, mouldings, figures, and drapery. But the same technique is as evident in every piece of marble that left their hands, and is the trademark to distinguish any Renaissance work whatsoever from the marbles of other times. The technique of the Renaissance sculptor is his own. The Greek sculptor could no doubt have played with his chisel any trick that seemed worth while. We are not able to judge with conviction of the surface of Greek marbles nor of Greek use of color. That later Greek art begins to care more for texture than did Phidian art seems plausible from the careful and soft treatment of surface in the Hermes of Praxiteles. The Renaissance sculptor cared overwhelmingly for surface effect, and enjoyed producing it, as all workmen like to do what they can do easily

and satisfactorily. The reasons for his facility are not far to seek, and are two. He is the descendant of the stone carver, and the apprentice of the goldsmith. From the first, he inherits a dexterity of hand which renders marble like wax to his touch. In the shop of the second, his hand has been trained to habits of accuracy and delicacy, and his eye to the love of graceful and inventive detail. His eye, however, has learned its power of discriminating niceties of light from painting. So much has he learned from that source that he seems often to look at his work with a painter's rather than with a sculptor's eye, for, to obtain a variety of values approaching those at the command of the former, he borrows from him linear perspective, and he plans the color of his stone, the lights of high to low relief, of polish and of texture, as does a painter the color scheme of his picture.

It is this sort of "picturesqueness," this quality dependent upon surface technique, which makes the unique sense charm of Renaissance marbles and gives us a set of imagined sensations as delightful as rare. Delicate modelling, skilful handling of planes, subtle balance of textures, suggest through their many gradations of light and shade a sequence of refinements, of touch sensations referred to the palm and the finger-tips, which seem to belong to some sense inactive in our ordinary experience, since they give us an imagined

sensibility of a degree of keenness that only the blind know.

As in all good art, the sense pleasure is firmly bound in with the emotional pleasure to round out our æsthetic enjoyment. To describe the latter is as difficult as to analyze the pleasant agitation produced in us by a bar of Schubert, a cadence in Wordsworth, or by "that green light that lingers in the west." The charm of its types we partly understand. They have the particularly modern charm of incompleteness, of that deviation from the typical, that inequality of attributes which, in our eyes, constitute individuality and suggest personalities with which our spirits discover sympathies.

Each of the minor sculptors has a way of recapturing and repeating favorite types in which he finds an evident expressiveness, with the result that we not only feel as if admitted to a sort of intimacy with him, since he so frankly reveals his likings, be it in his favorite bend of neck, contour of cheek, curve of brow, but we make acquaintance with the vision that is his type, which we may henceforth admit to our fancies, or look for in our experience. In the work of all there are types possessed of all the outward and visible signs of spiritual distinction, suggesting high passions, quickened sensibility, the stuff of poetry and romance.

So much for the charm of this sculpture. What is its value as seen historically?

Every period of an art practically contributes to the general progress and content of that art in two ways: first, by treating of new things, second, by treating old things in a new way. Now, in the limited field of sculpture, it is even less possible than in painting to treat of strictly speaking "new things." No doubt severe logic would place even the so-called "originals" of the Renaissance in the category of old subjects; yet so distinctly new is the method of approach that the result is really a new thing, and an original. To speak more concretely—the portrait, the relief, and the tomb are the originals of this period, and are its contributions to the content of sculpture. We know the beauty of the idealized Greek bust, we know the realistic Roman portrait, and we know that the Renaissance portrait is a new art object, combining the qualities of both, perhaps, but making a new æsthetic appeal. There were tombs of some architectural pretension in Gothic days; indeed, in the Italian churches they may be found side by side with Renaissance tombs on the same wall, but the latter, rich creations of an architect-decorator-sculptor, are hardly distant cousins of the former, and are new appearances in sepulchral art.

The Egyptians employed the lowest relief, the

Romans the highest. The Greeks used several planes, and even conventions of perspective with so exquisite a taste that one is allowed to think that their reliefs surpass in plastic beauty those of the Renaissance. But, nevertheless, the latter are an advance in the history of sculpture, for they mean new sensations, and the further development of the capabilities of material.

In its free statues, and in its equestrian statues, the Renaissance did not create new things. Its niched prophets are an advance in realism over the cathedral statues, and its two magnificent equestrian statues at Padua and at Venice outrank in life and power the Marcus Aurelius of Rome; but both illustrate a new, mildly new, method of treating old subjects, and give no originals to the history of sculpture. It is left for Michelangelo in the Late Renaissance to contribute further.

CHAPTER II

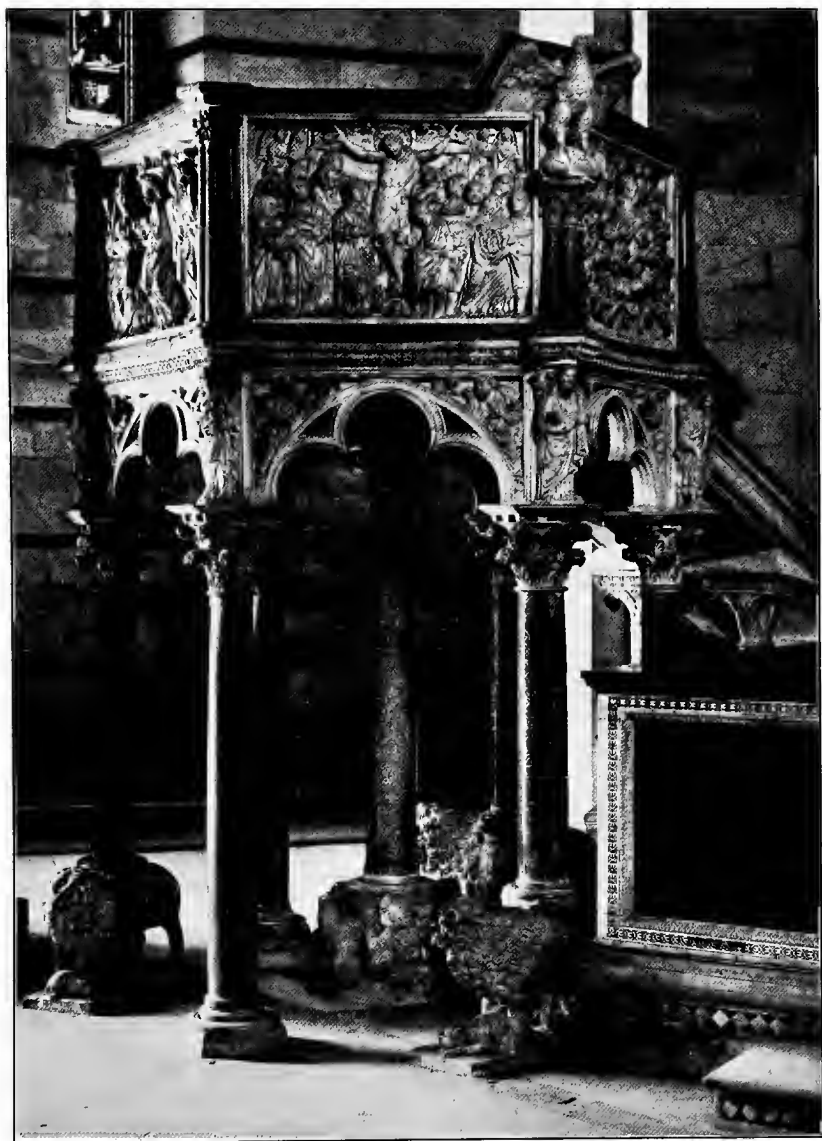

THE ORIGINS: THE PISANI

CHAPTER II

THE ORIGINS: THE PISANI

To pass from the mention of the "originals" of a period to a discussion of its origins implies a mental journey from the complete to the incomplete, as it were a passing from the symphony to the notes of its simple theme, and means a constant diminishing of pleasure. It is more exhilarating to pass from the imperfect to the more perfect, from the origins to the originals. There are only fitful gleams of æsthetic pleasure to be found in the beginnings of Italian sculpture. The intellect and the imagination fare better than the senses, yet the student will find, in studying the works of the Pisani, that his interest in them as links in the evolution of the art is accompanied by a genuine if vague sense pleasure. For the progression toward a satisfactory imitation of the human figure corresponds to an agreeable imagined sensation of growth, which is heightened by the contrast of Pisan sculpture with the deteriorated Byzantine types and the rude native stone carving which preceded, and whose conventionalized distortions appear here and there

in the new sculpture, side by side with living natural forms, like withered leaves in spring foliage. The sculpture of the ninth, tenth, and eleventh centuries, when regarded from the standard of architectural decoration, is interesting and effective. As sculpture, however, it can give few imagined sensations of touch that are agreeable. In fact, it is because we think of it as ornamental pattern woven of grotesques, that we do not feel the pain of its deformities. The figures seem to have been bound, according to the Chinese punitive method, into torturing, unnatural attitudes. The man who releases them, who first makes possible normal attitudes and natural movement for the cramped limbs, is Niccola Pisano, the first of the Pisani, who changes them from symbols into imitations. The state of the stone carvers of Niccola's day is comparable to that of a child before his first drawing lesson. He draws his picture of a man after the traditional pattern of childhood, making a little circle for the head, an oblong for the body, and hooks for legs and arms; and this he finds a satisfactory symbol, for he has never thought of the actual look of a man. Now at his first drawing lesson he is given a cast of a man or an actual object to draw from, and his art education has begun. There happened something like that in Tuscan sculpture. For Niccola of Pisa, already a famous architect, was dissatisfied with stone sym-

ROMAN SARCOPHAGUS
HIPOLYTUS AND PHEORA
Camp2 Santo. Pisa

bols, and gave himself drawing lessons from the reliefs upon an old Roman sarcophagus which still stands in the Campo Santo of Pisa. He profited from his lessons, and the sculpture of the Renaissance was born.

The way of it was this. The city of Pisa had finished its magnificent new Baptistery, and desiring a marble pulpit fittingly rich for the same, gave the commission to Niccola, the architect. Now an original and skilful architect like Niccola has no trouble with his main design. He plans his pulpit as a six-sided box, supported on six pillars of different colored marble. He connects the pillars by Romanesque arches which he fills with Gothic cusps. The sides of the box he plans to fill with panels in high relief representing scenes from Scripture. Since he is not a sculptor, it is for the sake of these reliefs that he takes his drawing lesson. From an old sarcophagus, on which is carved in Roman style the story of Hippolytus and Phædra, he copies attitudes, figures, heads, every fragment that he can work into his compositions for the Bible themes. In the Adoration of the Magi the seated Madonna is copied from the Roman matron who, on the sarcophagus, appears as Theseus's wife. The Samson who stands above the capital of a pillar at the left is copied from the Hippolytus of the sarcophagus. Everywhere, in the heads of youths, in the draperies, in gestures, in the horses, are transposi-

tions as skilful as his unpractised hand could make. Wherever he has had no model, as, for instance, in the two cramped figures crowded into the triangular spandrels on either side of the erect, vigorous Samson, the dependence of his untrained hand and eye upon a model is obvious. The impression made by this characteristic corner of Samson and the prophets is repeated in every other part of the carving. There is the vivid difference in sensation between human proportion and human distortion and the contrast in idea which it suggests, and there is all the interest of separating the copied parts from the other cruder parts, and of comparing the former with their prototypes on the Roman sarcophagus. And at a distance the panels are seen to be, in relation to the pulpit as a whole, a rich decoration for a well-proportioned piece of church furniture, whose mellow color, rich material, and harmonious structure make it a delight to the eyes.

It may be said, paraphrasing the words of an old writer, that the Renaissance sculptors issued from the Pisan pulpit as the Greeks from the Trojan horse, for there follow upon its completion commissions from the other Tuscan cities for works of the new sculpture; Niccola trains his son and his workmen to his enlarged view of form, and thus forms the so-called "Pisan School." Of that school there are three

NICCOLA PISANO
DETAIL (SAMSON) OF PULPIT
Baptistery, Pisa

master sculptors whose works mark steps of progression, — Giovanni his son, Andrea da Pontedera, and Orcagna the Florentine. For many years Giovanni works with Niccola in the latter's semi-classic manner, yet with some slight indication of his own strong individuality, which bursts forth finally after his father's death in his independent works. His hand and eye have indeed been trained to a degree of freedom and of amplitude of form, yet the classic qualities which attracted Niccola are to him inadequate means for the expression of a dramatic and passionate view of religion, more akin to mediæval violence than to classic serenity. In feeling the beauty of the classic type of form, Niccola was far in advance of an age whose true affinity was with the Gothic, as the works of Giovanni and of the later Pisani imply in their susceptibility to the influence of the French Gothic. The classic had served Niccola for a model. When, in beginning to work, he had not been content to follow the crude manner of his predecessors, he had used the antique as a means toward the satisfying of his idea of natural form. His son, Giovanni, passes on from the study of the model to the study of nature direct. But he learns nature's combinations slowly, and, filled as he is with the mystic and dramatic spirit of Gothic Christianity, his conceptions far outrun his skill of hand. Therefore,

while in dramatic action and feeling he far outranks Niccola, in the beauty of figures and of detail he is less satisfactory. To compare the restored pulpit of Giovanni in the museum of Pisa with that of his father in the Baptistery is to feel at first glance a difference in the spirit of the two. Giovanni's aggregation of symbols and allegories is a find for the religious symbolist, and perhaps a bit of a nightmare for the non-strenuous pleasure seeker. The panels are, like Niccola's, overcrowded with figures in high relief, which evidence more feeling for human movement, and perhaps less feeling for human form. As illustrations, that is, as illustrations adapted to Giovanni's day, they are realistic and impressive. The figures of the supports are expressive individually and are remarkably full of life, but, collectively, they are somewhat irritating, because of their difference of scale and their function in the architectural structure. As allegory and symbol, they are to most of us as unmeaning as the local hits of a Latin play, but they were no doubt a forceful bodying forth of contemporary ideas. In fact, not only in expressiveness, but in naturalness, Giovanni's art was a revelation to his time, and its influence spread throughout all Italy. He pointed to Italian art its true path, the study of nature. Yet although many sculptors worked under him in all parts of Italy, they made no appreciable

GIOVANNI PISANO
PULPIT (REPRODUCTION)
Museum, Pisa

advance, since they rather preferred to copy his designs than to seek to complete his view of natural objects. His true successor is Giotto. The torch which Giovanni, the architect-sculptor, had lighted is passed on to painting, and "Giotto is the greatest work of the Pisani."

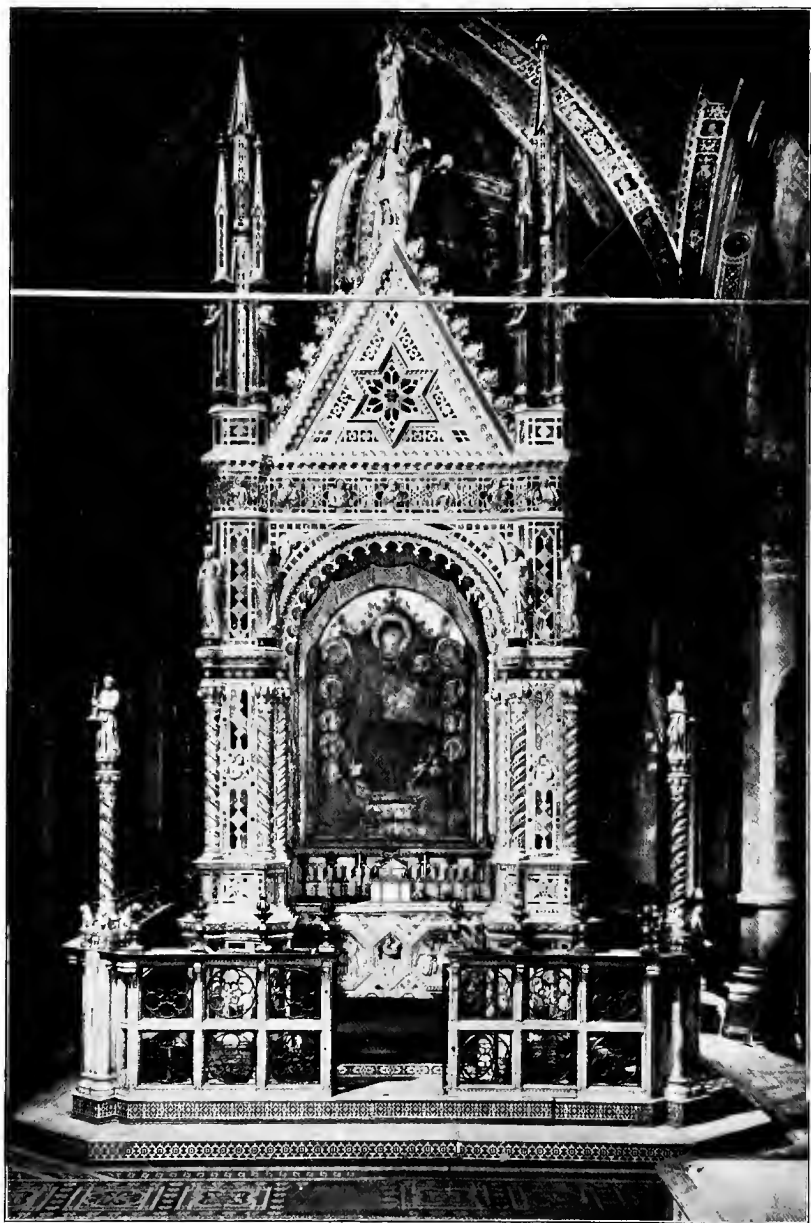

Giotto's influence was felt in all branches of art, in architecture and sculpture as well as in painting. It is by his aid that Andrea, the third great Pisan, carries sculpture beyond Giovanni's stopping-place. His reliefs on Giotto's campanile, and on the bronze doors which he cast for the Florentine Baptistery, have all the clearness and sententiousness of Giotto's frescos; they show a better observation of nature than Giovanni was capable of at his best, and there is a restraint and quietness about the figures which seems the blossoming of Niccola's attempt to reproduce the antique proportions. For the first time in the progression of Italian sculpture, one feels that the human framework is put together in normal average proportions capable of ordinary controlled movement. Notice, for instance, in the panel chosen for illustration, *The Beheading of John*, that the two quietly posed figures of the guards are, by virtue of their normal proportions and correct articulations, expressive of the latent possibility of any vigorous human movement. The weight and substance of their sturdy figures, their bearing down upon the

ground, is well contrasted with the lifting-up sensation communicated by the poised figure of the executioner. The latter, in its preparedness for action, shows Andrea's instinctive choice of the truly sculptural moment. Genuinely plastic in his use of few figures, fewer planes, and scarcely any accessories, his gates contrast most interestingly with those on the opposite side of the Baptistery made as their pendant by Ghiberti. Both have for their theme the story of John the Baptist, but the first are to the second as, in the "Ancient Mariner," the quaint, succinct, prose outline is to the vivid, detailed poetry which it accompanies. Andrea's clearness of silhouette and of narrative is pleasant to eye and mind alike, and many of his heads and figures have the charm of felicitous phrases in a well-told story.

Andrea's doors are incised and gilded by goldsmiths whose craft is the starting-point for both sculptors and painters. It is in the goldsmith's shop that Orcagna, the last of the Pisan school, receives a training which colors all of his artistic output, be it painting, sculpture, architecture, or poetry. To remember that fact is to explain to oneself the impression made by the only authentic piece of his sculpture that we possess, that is, the tabernacle which he made to enshrine the miraculous picture of the Virgin of Orsanmichele. The tabernacle is a Gothic structure of finely grained,

Baptistery Gates, Florence

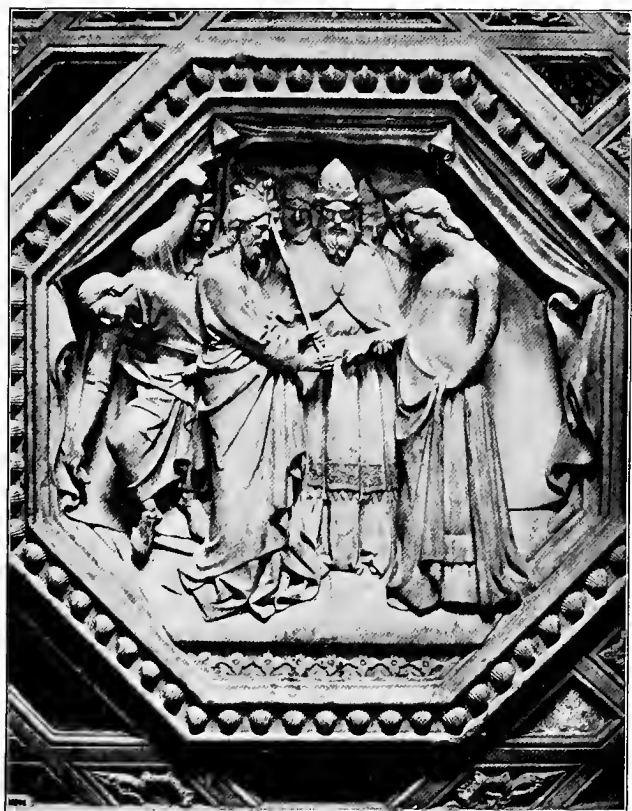

ORCAGNA
TABERNACLE
Orsanmichele, Florence

mellow-tinted marble, and every inch of it is enriched with carved ornament, mosaics, and sculpture, so that it seems planned as an enlarged jewel casket. In the upper part statuettes and busts are used with rich ornamental effect. The lower part is surrounded by a band of panels in relief, whose subjects are incidents in the life of the Virgin, and which are separated from each other by charming statuettes of the Virtues. Time has given to the marble the look of ivory-colored wax, and the impression of delicate softness of structure is increased by the refinement and loveliness of the figures. The chief characteristic of the figures, indeed, is a refinement which results from the elimination of violent action, and from the use of drapery, and which, while it affords no positive stimulus, means a tranquil satisfaction born of the absence of positive distortion. The details of the drapery and of the figures are pleasing, and the bounding lines are often so graceful that one longs to follow them with the finger as well as with the eye. They tell the story of Mary with a simple reverence and sweetness that become traditional in the treatment of the subject in Florentine art. In the Sposalizio, for instance, there is in the relations of the three figures, a tender girlishness in the half-shrinking Mary, a beneficence in the officiating priest, and a guilelessness in the Joseph for which even Perugino and Raphael, commanding the resources of painting

can, in later days, find no substitute. When one is not in the mood to enjoy detail, and to appreciate in turn, carving, mosaic, statuette, construction, this aggregation of small perfections loses half its charm, and seems a less noble work than the great arches of the vaulted roof above, in which, says tradition, Orcagna the architect had large share. And yet there remains in the mind so deep an impression of the richness and loveliness of the tabernacle that, as we construct it in memory out of its many exquisite components, it makes for Orcagna as strong a claim to fame as do his frescos at Santa Maria Novella or his Loggia del Bigallo.

The progress of the Pisan school in representation of form may be briefly summarized as follows: Niccola rejects the lifeless, formal symbols of mediæval carvers, and adapts to his uses a form that is an imitation, as far as it goes, of natural proportions, and which, therefore, bears with it ideas of its own. Giovanni does not confine his work to the scale of proportion which was Niccola's model, but passes on to the observation of nature, and to the representation, as it were, of new facts of form. These facts he is not always able to bind together into coherent relations, although in accuracy and extent they form a remarkable collection. Andrea learns, perhaps from Giotto, to separate the significant facts

ORCAGNA

SPOSALIZIO. DETAIL OF TABERNACLE
Orsanmichele, Florence

from the insignificant, and to so relate them that his figures are orderly, clear syntheses of the important elements of form. Orcagna has not Andrea's power of noting the significant, but he groups many graceful facts heretofore unnoticed, and, hinting at the Florentine mood which enjoyed detail in all the arts, he foreshadows Ghiberti, in whose work that mood found its most complete expression.

CHAPTER III

JACOPO DELLA QUERCIA

CHAPTER III

JACOPO DELLA QUERCIA

(1371-1438)

ALTHOUGH to make direct connection between the tentative appearance of certain tendencies in the last of the Pisan school and their establishment as dominant qualities in the first of the Florentines, one has but to walk from Orsanmichele to the Baptistry, yet, chronologically, there exists between Orcagna and Ghiberti a sculptor who was the genius of the Sienese school, and whose works are too important to be overlooked. Therefore we make the journey from Orsanmichele to the Baptistry by way of Siena, and the actual geographical detour is paralleled by the break in continuity of mood. Orcagna heralds Ghiberti as streaks of light in the east announce the rising sun. Jacopo della Quercia interrupts natural progress like lightning at sunrise. For, although being older than Ghiberti, he marks, in a way, the transition from the Pisan to the Florentine manner, yet so pronounced is his individuality that, despite many Gothic mannerisms

which connect him with his predecessors, his conception of form is so personal that he seems to stand outside of any school, and in boldness of vision and in vigor of thought he is nearer to Michelangelo than he is to his Florentine contemporaries.

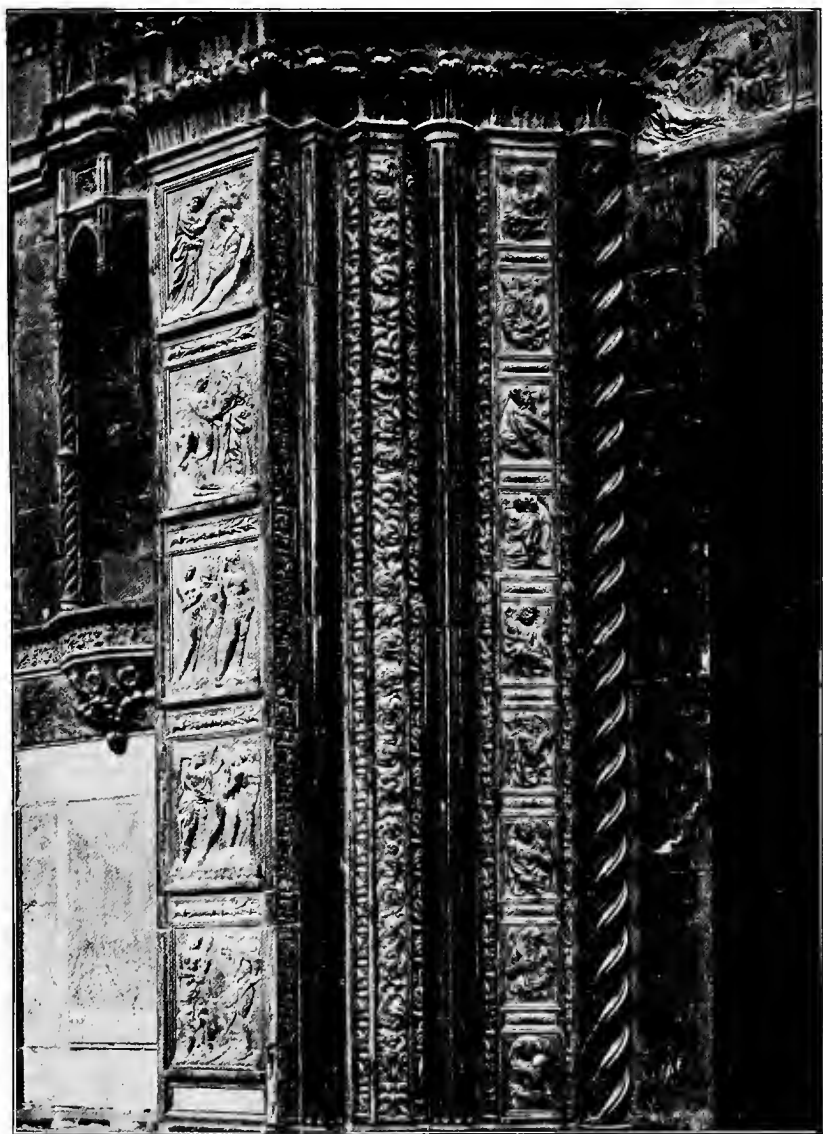

So striking was the effect of his style in his first masterpiece, the Fontegaja of Siena, that he was straightway called Jacopo of the Fountain. Of that famous fountain there remain only a few fragments which are huddled together in the cathedral museum. The modern reproduction of the fountain, which occupies in the piazza the site of the original, is interesting as giving an idea of a design which was unique and effective. It consists of a three-sided parapet surrounding the pool and affording space on its long side for niched statues of the Seven Virtues and a Madonna and Child, while the two shorter ends are filled by two reliefs, the Creation of Adam, and the Expulsion from Paradise. The modern copy is still white and new, and the figures have a sort of smug completeness which stands much in need of the ravages of time to soften into beauty. The fragments of the museum are more interesting, broken and rusted as they are. Their relationship to the mediæval type of the Virtues is evident in their heavy outlines and twisted draperies, but there ends their kinship to the meagre, ascetic type of Gothic woman. For these large-framed fig-

ures have bodies under their draperies, and the muscular necks, ample bosoms, and vigorous limbs had clearly more meaning for Della Quercia than had the faces. A model in stucco for *The Expulsion* may be seen in the cathedral library, where, in proximity to Pinturicchio's dandies clad all in purple and fine linen, its powerful nudity has the effect of a thunder-clap breaking in on the shrill pipings of frogs.

Such a powerful conception of the human figure is the most direct vision of muscular action as idea that we find in sculpture before Michelangelo. That it exerted an influence upon Michelangelo through the reliefs of the great portal of San Petronio at Bologna is more than probable. Time has dealt so hardly with the great door, and so blackened and eaten the stone, that the action of the figures is best studied from photographs and casts. In actuality, their indistinctness adds, no doubt, to their suggestiveness. Looking up from the broad steps of approach, the huge doorway seems to be framed in blurred shadows, from which are emerging the nude, muscular figures of men and women, which appear, even in these small panels, to be of heroic proportions. Considering their few inches of height, and the shallowness of the relief, they produce imagined sensations of remarkable intensity, as far removed from the ordinary as is the primeval from the civilized. For their emphasized muscularity sug-

gests strange capabilities of such movement as is born of primitive passions. Man's first existent state of harmony with himself and with his Maker is directly and strongly expressed by the powerful, free-moving figure of the newly created Adam who speaks face to face with his Creator, and by the perfect Eve who "lightly draws her breath and feels her life in every limb." What a tragedy is there in the contrasting figures of the fallen Adam who bends over his spade in sullen fury, and the Eve who, hampered by drapery, holding a distaff, and bound to the two infants at her feet, is caught in the toils of experience! Blurred as are the figures of Adam and Eve in the Expulsion, they yet give us the sense of looking backward through the ages at the primeval human outlined against the clouds of God's wrath, and they tell the tragedy of man's fall with a force equalled only by Milton, by Masaccio, and by Michelangelo.

Such power to express movement—a power so rare in Tuscan sculpture that we must wait until Michelangelo appears for its rebirth—is not often compatible with an ability to express perfect repose. And yet there is an early work of Della Quercia, the tomb of Ilaria del Carretto at Lucca, which is a famous example of the quality of "Repose." What remains of the original monument is placed in a transept of the cathedral of Lucca, and consists of the sepulchral effigy of

DELLA QUERCIA
LEFT OF PORTAL
S. Petronio, Bologna

the Lady Ilaria, a figure outstretched upon a low, rectangular base which is encircled by a frieze of garland-bearing cupids, vanguard of the cherubic host of Renaissance art. The figure is one of the most beautiful in all sepulchral art. The head is supported by pillows, the shoulders rest firmly on the slab, the arms lie quietly at full length with folded hands, the drapery, settled into long, still folds, covers the quiet limbs. There is no detail, from fallen eyelids to motionless feet, that does not contribute to the impression of a perfect repose which is neither the rigidity of death nor the relaxation of sleep, but perfect sculptural arrest. A round headdress, bound with sprays of conventionalized roses, makes with the plaited hair a frame for a face whose contours of brow, and cheek, and chin are most lovely, and which lifts itself above the curved collar covering the long throat as might a flower from its sheathing calyx. The repose of the figure, the simplicity of the drapery, the sweet delicacy of the features, fill one's sense with much tranquil pleasure, and suggest a possible and poetic type of woman. Is it a faithful portrait? Did so sweet a creature ever mate with the tyrannous and hated Lord of Lucca, and carry that flowerlike face into the midst of his roistering men-at-arms? Coming into the dim cathedral from the hot piazza, glaring under a July sun, one finds it easier to fancy that the quiet

figure is the image of cool and temperate spring, waiting there until the heats have passed and the bare winter gone. When the first roses bloom in the hedges, those quaint sprays of her chaplet will unfold, a rose flush will creep down her white brow, the lids under the arched brows will lift, the tender bosom will rise and fall, and, sheathed in her green mantle, while the little loves swing their garlands about her, the spring will pass from the shades of the cathedral into the light and fragrance of blossoming vineyards.

CHAPTER IV

GHIBERTI

CHAPTER IV

Ghiberti

(1378-1455)

No greater contrast in style, and therefore in resulting æsthetic enjoyment, can be imagined than that existing between the bas-reliefs of the portal at Bologna, and those which were being moulded at the same time in Florence for the bronze doors of the Baptistery by the young Ghiberti whose trial piece for the commission had outclassed both Della Quercia's and Brunelleschi's. In going from Bologna to Florence, in visiting Ghiberti's door after Della Quercia's, one seems at first to shrink from the Titan to the petit-maitre in exchanging the stimulus of the muscular nude for that of the elegantly draped. [The figures of the former are but little larger than those of the latter, but they completely fill their panels, gaining by their isolation from natural objects and from other persons an added effect of individual power. Ghiberti's figures are seen in relation to a background and with other figures, and give not an impression of

grandeur but of grace, while picturesque effect replaces more plastic feeling.

These doors and those made later for the east entrance of the Baptistery represent the artistic product of Ghiberti's life, for he worked on them from the age of twenty-five, and finished the second pair only a few years before his death. He filled other commissions through the years, but we are unable to judge of his work as a jeweller as nothing has escaped the melting pot, and his several large statues of bronze, on the whole much less successful than his smaller castings, show no merits not better displayed in his gates. His gates, then, are both the summary and the exposition of his characteristics.

The general plan of the first gates, their division into panels, filled by medallions containing reliefs and separated by mouldings, was determined by the plan of Andrea's gates to which they were to be pendant. In any comparison of the two, their resemblances are seen to be but frail threads binding together works which are widely dissimilar in technique and in spirit. Several of the panels have for their subjects the same incidents, but, whereas Andrea's main purpose is to say a something, Ghiberti's is to say that something in the most attractive way. He accomplishes his end by abandoning Andrea's sententiousness, the natural plain speech of the sculptor, and by admitting every

GHIBERTI

Baptistery, Florence

detail of narrative for which he can find place, and every beauty of grouping, of drapery, and of figure that study can discover, and, as his best means to an end, he begins to make use of linear perspective. Both sculptors have made the Baptism of Christ by John the subject of one panel. As a narrative of a Biblical incident with which we have certain associations, Andrea's is the better. The figures of John and of Christ express in their attitudes that impetuosity of the disciple and that earnest dignity of the master which accord with our conceptions of their character, and the figures of the angel and of the dove add sufficient narrative detail to make the panel a good illustration of an incident with which we are familiar. If we linger over the panel, it is to find ourselves thinking no longer of what speaks directly through our eyes, but of the characters and the story, in short, following the associations of the subject. Now, in Ghiberti's panel, the starting-point of formal subject is the same, but our thoughts take us into another sphere. As illustration, it holds us only long enough for us to note the incongruity of the studied attitudes and the effectiveness of the detail. But as a composition of lines to be followed and related, as modelling which varies from high relief to stacciato, and contrasts the nude with the draped, as an effort to use perspective in representing the motion toward

GHIBERTI
SECOND PAIR OF GATES
Baptistery, Florence

is a door of richly sculptured bronze, the unity of whose plan is felt even while the diversity of its components is seen. It consists of ten panels in relief, which are separated by a moulding in which at regular intervals are placed niched statuettes and heads—a plan of division as simple and yet as varied as that of a garden plot divided into flower-beds by borders wherein the same color occurs at regular intervals, but the flowers that make each color spot are sprung from different seed. The heads placed at the corners of the panels are some of them portraits, some ideal, and the statuettes are similar only in their exquisite grace and finish. As for the panels, what wonderful seed sown there has blossomed into shapes of youths and maidens, and stately elders grouped before spacious porticos, beneath trees, and under skies through which are flying the angelic hosts! One sees at once why Ghiberti is said to have made “pictures of bronze on a canvas of steel.” He has placed his figures of varying proportions in landscape and architectural backgrounds at varying distances from the eye, making use of the laws of linear perspective to perfect the illusion of a third dimension. The liking to call them “pictures in bronze” comes more from the mind’s recognition of the skilful use of many planes and of graduated proportions, than from actual, visual impression of depth. For although photographs of

the reliefs look much like photographs of paintings, so marvellous has been the application of the laws of linear perspective, yet in reality aerial perspective is as necessary here for effects of space as in any of Ucello's painted problems in the "dolce cosa." So many are the charms of the crowd of little figures, that one is in no haste to read the stories of the panels. Each is delightful just in itself, without thought of its rôle in the narrative. So gracefully posed are they, so elegantly draped, so exquisitely wrought, that one quite longs to take them in one's hands, to finger them, examine each perfect little whole on all sides. Yet this feeling for the separate figure, akin as it is to our feeling toward the bijou, is, when we consider the figures in their relations to each other and to the backgrounds, lost in a surprising largeness of effect, in a recognition of significant action taking place in spacious surroundings. How little actual size restrains greatness and dignity of impression is illustrated by the panel whose limits expand to furnish a fit setting for the visit of the Queen of Sheba to Solomon. The meeting takes place before a vast palace whose porticos stretch far back into the distance. Attendant upon the royal personages are their respective retinues, a crowd of figures, counsellors, women, men-at-arms. The suggestion of a crowd of people has been obtained before

GHIBERTI

PANELS OF EASTERN GATES

THE HISTORY OF NOAH, SOLOMON AND THE QUEEN OF SHEBA

Baptistry, Florence

by use of fewer figures, as witness the procession of the Parthenon. The marvel here is that so many figures have been disposed without confusion in so limited a space. Ghiberti's mastery of perspective is well-nigh absolute. The figures in the immediate foreground are in the round, and project beyond the cornice of the panel. The relief subtly and constantly diminishes until a few lines drawn on the background represent the figures farthest away from us. Each remains in its proper plane, each has freedom of movement. The halves of the panel balance perfectly, and Ghiberti's consummate skill in composition is shown in the variety in grouping and in attitude of the figures making up the balanced parts. Contrast also the listening dignity of the attendants who are assembled about the royal personages with the animation of the gossiping groups who wait in the outer court. These latter contain some beautiful figures of youths. The horseman at the right is worthy a place amongst the Athenian youth of the Parthenon frieze, and the youths in the foreground, in their finely wrought armor and their carefully draped cloaks, have a vigor and beauty of form which might make them seem indeed a "renaissance" of the youth of Antiquity. And when, to their company, we add from the other panels and the mouldings other types of beauty, the angels who appear to Abraham, the lovely, newly

created Eve, the sons of Noah, the young David, etc., we have a pageant of selected types whose beauty and variety remind one of the year's procession of flowers.

Indeed the keynote is selection, which admits no element, not even the smallest detail, that is not capable of adding to the sum total of enjoyment. The inventiveness and richness of detail must have delighted the Florentines who were, and are, peculiarly susceptible to the appeal of cumulative detail. The panel which relates the story of Noah is almost as delightfully garrulous as a fairy tale. There is pleasure merely in the recognition of the animals who march so gravely around the ark, and the several stock incidents in the life of the patriarch, his coming from the ark, his sacrifice, and his drunkenness before his sons are all related with fulness of detail, even while they are all combined into one harmonious composition. He who is versed in the Scriptures sees with amazement that in each panel are several scenes, yet so clever is the composition that each panel appears to the eye as one scene, and, without sacrifice of clarity or harmony, there is an immense gain in richness and interest. Far more study is necessary to gain an adequate appreciation of the skill in composition and in technique of these famous doors upon which Ghiberti spent the greater part of his life. The excitement of overcoming diffi-

culties in casting, etc., the pleasure of mastering the principles of perspective, the unremitting search after beauty, were more to the artist than were the formal subjects. And we, too, when we have once comprehended the stories, set them aside and take our enjoyment from what meets the eye and leads the thought into other regions than those of the old book. In its charm of variety for the eye in small compass, the door is more properly goldsmith's work than sculpture. Yet its nobility of scope and beauty glorify it into a kind of sculpture never dreamed of before, and it makes a unique æsthetic appeal which is not that of sculpture, nor of painting, nor of goldsmith work, but has some flavor of them all. The labor of thirty years of hand and brain, the study of the classic and of nature, have left us grace and beauty incarnated in youthful figures who move in rhythmic measure through spacious scenes, denizens of a poet's "realm of gold."

CHAPTER V

DONATELLO

CHAPTER V

DONATELLO

(1386-1466)

GHIBERTI stands for one kind of artistic vision; Donatello is typical of another more rare. To the first, certain qualities of form make so strong and constant an appeal, that all his work from his earliest to his latest seems the continuous effort to find their adequate expression. The latter pays no lifelong service to any one ideal combination of qualities, but uses varying symbols of form to express what appeals to him in different objects at different seasons of his life. With men like Ghiberti, it is as if in early life they heard a melody which enraptured them. All later study and experience from youth to age is forced to contribute to their power of reproducing it. Varied, enriched, developed as their work grows to be, through it all runs the old melody, the stuff of its weaving is always the same. In Renaissance painting, Botticelli is a familiar illustration of this temperament. In all of his pictures he seems to be tracing the same pat-

tern of line, and face after face suggests the same mood. Perhaps this is part of his attraction for the present day. In this epoch of specialization, we are wonted to the special personal vision, which, when genius goes with it, gives us art, if narrow yet intense, and of poignant æsthetic appeal.

In artists like Donatello, however, the energy of imagination is so great that it extends itself over a broader field, and the intelligence is so penetrating that it sees in each object its own significant features. Therefore we have sculpture ranging in technique from the equestrian statue of Gattamelata to the delicate bas-relief of the young St. John, and in subject, from the joy of singing children to the agonized repentance of a Magdalen. We recognize his hand in a work, not by the appearance of some favorite combination of qualities, but in the serious effort to express directly and definitely the visual truth of each object. In literature, Shakespeare is the perfect illustration of this artistic temper. His characters have been created into life, each a personality with which actions and speech are congruous, so that, as individuals, they are even more real to us than is Shakespeare himself. A marvellous ventriloquist is Browning, but we feel that it is he, and not his characters, who speaks, despite the clever mental makeup. Our enjoyment of subjective art will always be limited by mood; objective art, on the

contrary, has in its wider scope more chances of meeting different moods. Ghiberti makes hundreds of figures, but no matter with which figure one identifies himself, he will find himself stepping to the same music. But each of Donatello's characters moves to the music which he alone hears, and, therefore, while for us they all have this common characteristic, that they communicate life, in each we can live a different moment of life. In each there is always on the sculptor's part the same sureness in the selection and emphasis of the expressive appearance, and on our part the same ease in recognition as if the sense of sight had been so quickened that it connects by a lightning flash the processes resulting in sensations, emotions, and ideas. Such insight into character, such choice of the expressive appearance, such communication of the life of forms are Donatello's characteristics. His work, then, is not an orderly progression toward the adequate voicing of an ideal, not, as with Ghiberti, the unfolding of a perfect flower of art, but each work gives its individual impression, and to gain a just idea of Donatello each should be studied. But it is possible to divide roughly into four chronological periods, since certain influences and circumstances of growth bind together, although very loosely, certain groups of works. There is the monumental period from about 1405-1433; the classic period from 1433-1444; the

period of maturity spent at Padua, 1443-1453; and the period including his last years in Florence until 1466.

Donatello's earliest commissions were for statues for the façade of the Duomo, and for the niches of Orsanmichele at Florence. As might be expected from the sculptor's youth and the existent strong tradition of cathedral sculpture, there is at first no violent break with the conventional types, and yet gradually his genius forces a current of life into them such as they never knew before, and working as he does from living models he makes persons of them one and all. Donatello begins by imbuing with some semblance of life the traditional ecclesiastic characters; he ends by creating absolutely new types, expressive, but realistic to the verge of ugliness. In the St. George of Orsanmichele he best realizes the embodiment of a simple, definite, pleasant thought in form as simple and definite and pleasant. The bronze figure in the beautiful niche at Orsanmichele is a copy of the marble original now in the national museum, the Bargello, where, in a plaster niche, in indoor light, the weather-stained sturdy figure looks strangely out of place. Years of battle with the fierce winds and rains of Florence have streaked the armor with gray and stained the marble, adding immensely to the sentiment, since the scarred shield and begrimed face speak of conflict already won. The figure stands on both feet, as firmly as a rock, balanced

DONATELLO
ST. GEORGE
Bargello, Florence

1A16

by the heavy shield, and a mantle which fortunately falls behind the figure. An effect of a readiness for forward action which, as legend hath it, caused Michelangelo upon seeing it to exclaim, "March!" comes from the drawing back of the left leg and shoulder and the slight twist of the torso, emphasized by the pose of the head and the knitted brows. The satisfactory firmness of the figure is not the rigidity of the armor, but the steady support of muscles underneath. The pose has no especial grace or nobility, there is no charm of line or modelling. What is it, then, that makes the St. George, as every frequenter of the Bargello knows, one of the most popular of statues? It is because it is the well-nigh perfect illustration of one of our most familiar and fond imaginations, "the soldier-saint," the knight *sans peur et sans reproche* standing ready in strength of purity and of youth to do battle for right. The treatment of the figure, its solid mass unweakened by detail, its quiet pose and broad modelling, and its alert head, make for the impression of youthful strength of body, and the face, unlined as yet by age and disillusion, completes the character in its resolute brows and chin, its glance of ardent purpose, and its sweet steady mouth. The bodily forms selected stand for few and simple imagined sensations, but they connect immediately with a definite stock of our pleasantest associations. There is, in looking at it,

all the pleasure of recognizing an adequate illustration of a favorite thought, and of feeling, as we identify ourselves with the character, the working in us of its invigorating qualities of youth, courage, and hope.

A transition in thought, if not in date, between the, in a sense, Gothic sculpture of this first period, and the next period when classic influence shows itself, is made by the shrine in Santa Croce, with its bas-relief of the Annunciation. The architectural framing, in its design and its details of mouldings, etc., is evidently inspired by the classic, but the simplicity of thought and execution in the figures connects them with the St. George. The relief and the frame are cut from *pietra serena*, a soft gray stone, and the details of the mouldings and the background are picked out in gold. The figures, almost in the round, are of the same race as St. George. Broadly and simply modelled as they are, their ample proportions and smooth youthful faces make clear to us our pleasure in tranquil, vigorous bodies and untroubled spirits. The Madonna turns a bit awkwardly, as if startled by the appearance of the messenger, but the certainty expressed by the angel's steady pose and earnest gesture is answered by the serenity of her face. As with the St. George, the work is satisfactory illustration because of its inclusion of the true associations and its exclusion of false associations. An angel filled with joyous solemnity bears God's word

DONATELLO
ANNUNCIATION 1430
S. Croce, Florence

to the chosen woman, who trembles, yet rejoices. That is the familiar subject. The associations that cluster about it have been created by the simple Biblical narrative, and are here adequately suggested by the distinction of the figures, the serenity of expression, the delicacy and purity of color and ornament. Nor is the hint of mysticism lacking, if one views the relief from the nave or the farther aisle. Seen through the gloom, the broadness of modelling, and the color and softness of the stone combine to make the figures creations of gray mist, which, in the trembling light cast upon them by the red glow of the shrine lamp and the flickering votive candles, seem to palpitate with emotion.

Donatello had always been a student of the antique. During the years following a visit to Rome in 1433, he restored many ancient marbles for Cosmo de' Medici, made for him a set of medallions for his palace after antique gems, and, in other works of this time, shows a classic influence which reflects not only the enthusiasm of his patron, but his own admiration as well. Yet for him, even more than for the other masters of the Early Renaissance, the antique is a teacher of general principles of technique and proportion, not a formula to be repeated. Its influence is present in these years as a force to modify his strong bent toward realism, and marks a period containing the works of

greatest beauty. The most obvious traces of classic form are found in the David, a bronze figure of a youth, made for Cosmo de' Medici, and now in the Bargello. The first nude bronze of the Renaissance, it must go back to Roman times for a predecessor. Its easy pose, with one hip thrown out, is distinctly reminiscent of that type of athlete deriving from the Praxitelean. The bodily forms are most interesting in being a combination of ideal and natural, as if made with the antique in mind and with a model before the eyes. The two elements are easily distinguishable, but are felt to vibrate in harmony with the life of the whole figure. Perhaps herein lies the charm, in the naïve yet amazingly clever union of the ideal with the realistic, the echoes of the antique blent with the strident modern. The spare, yet well-covered, torso, and the legs so graceful in action and in outline, contrast with bony, protruding shoulder blades, and awkward skinny arms, apparently truthfully copied from some young Florentine. The same charm exists in the contrast between the classic details of the armor, the giant's casque, and the rustic hat (is it a leaf from the edge of the brook, or the petasos of Mercury?) which covers the long locks, and shades a face whose dimpled chin and low brow are those of an Italian goatherd such as one may meet any day in the campagna. Who seeks in this slight languid boy an illustration of Bibli-

cal story must perforce content himself with what suggestion he can find in the stone half concealed in the left hand, in the sword, and in the head of the poor giant himself whose beard is so carefully arranged and whose helmet is so beautifully wrought that I fear his chief value is artistic rather than narrative. Evidently Donatello himself has been more concerned with making the head a fine decorative base for his statue than with the expression of the dramatic or the moral. His interest has been in the modelling of the nude, in the goldsmith work of detail, and our pleasure comes from the contemplation of these same things. In a bronze, the "architectonic" appeal of structure, the hold of the muscles on the bones, is more obvious to us than in a marble where the material gives a chance to represent the texture of the skin. This figure, by the careful severity of the modelling, the apparent "hardness" of the muscle, gives the effect best brought out by bronze, and its size makes effective in bronze what would be insignificant in marble. The decorative details speak of Donatello's early training in a goldsmith's shop as well as of his study of classic ornament. The helmet, with its design of busy cupids, is worthy of a Roman hero, and each strap and greave is as beautifully wrought as a bit of jewelry. Of all the Davids to follow from other masters, none compares with this in masterly treatment of material, and in that charm which

suggests, now the youthful athlete, now the herd boy of the campagna.

The effect of Donatello's visits to Rome appears in a quite different way in another work of this period, the Cantoria or singing-loft, made for the Duomo in competition with Luca della Robbia. The classic influence is shown in the architectural and ornamental forms, and in the use of mosaic to fill in the spaces of the background. A favorite Roman motive, the cupid, becomes the theme as a band of dancing children. They are broadly treated with reference to the height above the eye, and make a picture of living line, and of pleasant light and shade, and give an impression of childish joy in abandonment to music. In its presentation of one simple idea, the movement of dancing children, it contrasts with Luca's loft, whose panels sing with the music of children and youths and divers instruments. Donatello's direct subject is clearly the whole gamut of movement possible to childhood. And its sense appeal is the stronger because the child is the only type used, and each attitude reënforces and enlarges the appeal to one type; and in retrospect it is more delightful than Luca's, because the one definite feeling caused by it is more easily revived. Luca's is more elaborate and careful work, and, because of its variety and associations has a stronger attraction for those who prefer the pleas-

ures of recognition and suggestion. Truly it is a thing to come many times to see until one has made friends with each little chorister. At Donatello's, let one look long and steadily, and then forget it as a stone frieze made by one Donatello. Only keep it a place in one's mind as a memory of something seen once, perhaps 'twixt sleep and waking,—a band of children, half real, half marble, dancing and carolling to happy music.

The third period of Donatello's artistic development, comprising the years (1444-1454) spent at Padua in making the bronze altar for San Petronio, and the equestrian statue of the condottiere Gattamelata, is the time of maturity in technical skill and in range of thought. Donatello is now fifty-eight years old; for about forty years he has been constantly studying nature, the antique, and his trade. One might reasonably expect, then, to find in this, the only important commission outside of his own city, a *tour de force*. And such it is, for it comprises reliefs which are his masterpieces in relief, separate statues of great character and beauty, and much ornamental detail exquisitely designed and wrought. The parts of this altar which were scattered about the church have recently been put together, but one cannot judge with certainty of the original effect. However, in the Gattamelata, Donatello's genius comes to a focus, plain for all men

to see. There appear his boldness and originality, because this is the first equestrian statue since the Marcus Aurelius of Rome; his energy and industry, because he has made a careful anatomical study of a horse — no small thing to do when one is fifty-eight years old; his power of seeing the essential visual facts in objects and of expressing character thereby, because, although a regiment of equestrian statues has been made since, this of a petty captain of the fifteenth century is still one of the finest in the world. Consider your nearest park statue. Perhaps the horse is most cleverly made; he rears with great spirit upon his hind legs, and, most like, his rider, famous general though he be, serves the ignoble end of a lump of lead to hold Pegasus to earth. Perhaps the figure, dignified and commanding, is only spoiled by being set upon so fantastic a base. Or perhaps the group is picturesquely treated, — one is glad to catch sight of it as one moves by at a brisk pace, to feel the communication of its motion, its pressure against the air, obtaining the same kind of effect that one gets in all its intensity in the moving pictures of the biograph. A five-minutes' stop of steady contemplation would bore us, would make us quite sensible of the emptiness of its content as a whole. The Gattamelata is great because it has none of these defects, and some positive merits. There is, to be sure, a defect of observation in

DONATELLO
GATTAMELATA 1447
Padua

the movement of the legs of the horse, but he is well studied for all that, and gives our imagination all that it finds necessary. Moreover, the horse is properly subordinated in interest to the rider, who is one of the most living of Donatello's creations. And yet, it is not a portrait of Gattamelata, it is a portrait of Gattamelata-condottiere-on-his-horse. A vast difference there! As a study of character, it gains much of its force from the fact that, for the first time, the sculptor has a chance to portray a man of his own day without the toga-cloak disguise of a Biblical personage, clad in his own proper equipment, and as the centre of a contemporary pageant. And yet, although it is a moment, and a man of the Renaissance that he has set there, he has represented those things that are eternal, namely, the powers of a man to command his fellows. (Where the impression of a personality might so easily have been sunk in the exhilaration of action, in rich effect of armor and harness, it is the character of the man and the reality of the moment that impress us. There were crises in those days, and men to meet them! There is this thought for the mind, and there is inexhaustible treasure for the eye. What sureness of modelling in the head, what exquisite exactness of bone, and hollow, and wrinkle in the face, and in the ungloved hand! How carefully the horse has been studied, joint, and muscle,

and vein! Here is a war-horse of the Middle Ages! With the smooth surface of his powerful body contrasts the rich trappings and armor. "One of the charming *putti* from the richly decorated saddle, one square inch of the horse's trappings, would furnish matter for a discourse and make the reputation of a collection."

Donatello's last years were passed for the most part at Florence, in designing and beginning the two pulpits of bronze for the church of San Lorenzo. A phenomenon which often strikes one in following the mental life of men of genius as shown in their works is that, in the last years of their lives, their thoughts tend to become too deep for formulation, and their art suffers under the pressure of matter too weighty for its expression. King Lear is not a success on the stage. Donatello's latest designs for San Lorenzo are so charged with dramatic intention that they overstrain the limits of relief. That they are in great part the work of his pupils, must be taken into account when, at the first glance, and hindered by the gloom of the church, it seems impossible to make out the figures. After some study one gets the subjects and the action, and is aware that they have conveyed to him a sense of the confusion of crowds, of the dramatic aspects of the scenes of the passion, and an echo of the emotion that is aroused by the Crucifixion of Tintoretto. But he is conscious that it is his own

DONATELLO
BRONZE PULPIT
S. Lorenzo, Florence

thought, rather than what meets his eye, that is leading him into well-known paths of association. Now and again a part of a figure, a thigh or a shoulder, or the powerful torso of a Roman centurion makes the appeal of generous modelling, but the planes are so confused that all is blurred that should be clear, and only fragmentary, broken sensations are possible. In a photograph one grasps at once the boldness and originality of the scenes, and the invention and beauty of the details. But it is another matter to stand under the sombre bronze boxes in the dark church and strain eyes and neck in looking. The man who looks at sculpture because it gives him pleasure, and is honest in his accounts with himself, may feel that the fatigue of working for his impression rather overpays its value when obtained.

Now, although in his latest work Donatello seems to have strained his art, yet his influence upon Renaissance sculpture really tended to keep it within true plastic limits and to balance the picturesque influence exerted by Ghiberti. His positive influence must be looked for in Florentine painting rather than in sculpture. For his studies of the nude, of anatomy, and of drapery were of great service to a school of painting which concerned itself before all with the representation of form. For the rest, we read that he was much beloved of his friends for a kind of simplicity of nature

which found fine clothes unbearable and a country estate not to be endured. He probably never bothered himself about the ethics or æsthetics of his art, but enjoyed his *feste* and spent his workdays in hard labor of head and hand—a true artist life whereof we profit.

CHAPTER VI
LUCA DELLA ROBBIA

CHAPTER VI

LUCA DELLA ROBBIA

(1400-1482)

WITH Ghiberti and Donatello ranks Luca Della Robbia, the third bright star in the Early Renaissance heavens. But little younger than they, he sprang from the same soil, and came under the same influences. The same sun and rain, the awakening to nature and Antiquity, aided in his growth as in theirs. But each developed after his kind. From nature they were busy getting much the same sort of fact: the difference in temperament comes out more evidently in their respective attitudes toward the antique. Ghiberti was an enthusiast, he reckoned time by Olympiads, he collected antique marbles and was enraptured with their beauty. On his wonderful gates he transposes the Hebrew narrative into suave Vergilian metre, melodious and graceful. Donatello has studied the remains of Antiquity at Rome, he restores marbles for Cosmo de' Medici, he makes medallions in the classic style, he constantly uses classic decorative motifs. Yet he is

always at heart a realist. The classic but frees him from mediæval convention, gives him leave to be faithful to nature, but teaches him how to see it. Now Luca, with scantier knowledge of the antique, and showing in his work fewer formal traces of it, is the most nearly Greek of them all, for he approaches his work in the Greek spirit with that fine plastic intelligence which feels the limits of its material and brings out the greatest beauty within those limits. Neither Ghiberti nor Donatello held the classic attitude toward their subjects. The first sunk the plastic in the picturesque, the second in the naturalistic and dramatic. Luca's range of feeling is not great, but he is always truly plastic in its expression. The classic arouses in Ghiberti an enthusiasm for grace and harmony, which, uniting with his Gothic inheritance, produces a new and unique beauty. Donatello learns from the classic to be faithful to nature and to his own view of her, but his thought is so entirely that of his own day that his work is most unantique, most typically Renaissance. Luca's subjects are, on their face, quite as unclassic as can be. No Greek would have thought of representing mothers and babies. But the impression which those quiet mothers, rounded babies, and blithe angels make upon us is that there exists a joyful oneness of physical and spiritual health, which, after all, is surely the Greek motif translated into the vernacular.

LUCA DELLA ROBBIA
MADONNA OF THE ROSES
Bargello, Florence

His work is commissioned from ecclesiastic sources, or is at least to answer a religious purpose, and must be an Adoration, or a Visitation, or the patron saints, but, despite varying names and symbols, Luca's blue and white is singing over and over the same song of serene physical well-being, animated by a mind as tranquil. There are critics who trace the evolution of Luca's conception of the Madonna through his types. Here he is thinking of the Queen of Heaven, there of simple maternity, etc., a species of botanizing which may add to the valuable information which we store away on our bookshelves, but for which we care not a whit when we come upon Luca's flowers in their *locum proprium*, the cool dark of churches, or growing in narrow dirty streets as the dust-powdered gentians in the highway, and accomplishing our happiness much as do all of "nature's old felicities." One may see in the Bargello a fine collection of Della Robbias, as clean and shining as any good housewife's best china. The polish vaguely disturbs one for a time, although it perhaps intensifies the impression of exquisite cleanliness, an integral part of a charm which is made up of all those elements of color and of form which spell refreshment to our senses and convince the spirit that innocence, simplicity, and joy are as common as motherhood.

The works of Luca, in theme, color, and form are the

notes of an exquisite chord. The modelling is broad, because the clay surface must be smooth enough to take evenly its coat of enamel, but shows a knowledge of form as exact as Donatello's, and a love of its beauties as keen as Ghiberti's. The faces are not classic, but very modern in delicacy of feature and sweetness of expression. Select the sweetest faces of any nationality, and you will find Della Robbia types. They speak then a universal language equally intelligible to the different nationalities who pass before them in the museum, equally intelligible to the different sects and ranks who pass their shrines in the streets. The message of youth, of health, of serenity, is always there to be read, and, in addition, each work has of course its special associations, as it has its individual forms. Luca conveys much by the expression of his faces. Compare, for example, the gracious worldliness of expression in the group of the Via dell' Agnolo with the rapt devotion of the group of the Bargello. In the former, the attendant angels, justifiably proud of their service, seem to mark with alert eyes the effect of the benediction of the divine child. In the latter, the angels and the Madonna herself gaze upon the divine infant with eyes which have the clairvoyant expression of those of the Sistine Madonna.

That Luca's charm depends upon his skilful observation of the limits which he sets is clear enough in

LUCA DELLA ROBBIA
 VIA DELL' AGNOLO, FLORENCE
 THE BARGELLO, Florence

considering the later Della Robbias who violated those limits and whose work steadily deteriorates.

Andrea, Luca's nephew, was, to be sure, a man of great talent, and his work is often as lovely as Luca's. In general, however, it is more elaborate in composition and in ornamental details.

One of the loveliest of Andrea's reliefs, and one which circumstances combine to render most pleasure-giving, is that of the Coronation at the convent of the Osservanza in the environs of Siena. It is usually in the spring that the traveller finds himself in Siena, and his visit to the Osservanza takes him out from the town into a spring landscape that tunes his mood to the spirit of the early Della Robbias. Moreover, he has left behind him in that grim town of Siena, whose towers and battlements are, as he looks across the ravine, a frowning silhouette against the blue, an art whose memories lie back of his eyelids like those of strange dreams. He remembers the treasures of design in the rich gloom of the cathedral; he sees the brilliant frescos of the library with the red, and green, and gold splendors of its ceiling, and he has not forgotten the primitifs of the Accademia, those Byzantine Virgins clad in the glowing ashes of their splendor, and with some element, almost of malevolence, in their gaze. With such memories, as of the occasional strange gleams and palpitations of sunrise

in this weird hill country, the Della Robbia to which he comes seems to afford the contrast of the blue-and-white familiarity of high morning. Tranquillized by the sanity and serenity of nature under this blue dome of spring sky, he is in the mood to fancy that Andrea has incarnated those qualities in his figures. The formal subject, to be sure, is the Coronation, a subject which the Renaissance treats as a well-known melody, making its essentials always the same, the grace of Mary's head bent in meekness, the tender beneficence of the Holy Father, the rapture of attending angels, and the joyful adoration of the saints, and the result one of the loveliest lyrics of the Christian anthology.

Andrea's treatment is the simple one that belongs to his material, and is only noticeable in a choice of refined, graceful forms, which make the expression and the sentiment one. The composition is simple and clear. The two halves of the panel balance pleasantly, are charmingly diversified in grouping and in individual attitude, and are connected with the central action by the ring of cherubim. There is also a variety in the expression of the faces which makes personalities, not only of the saints, but even of the heads of the cherubic frame. The figures are accurate, and satisfactorily felt under their simple drapery. The modelling of the faces and hands is careful and delicate, that in especial of the thin faces of the male saints being of

ANDREA DELLA ROBBIÀ
THE CORONATION
Osservanza, Siena

a degree of exquisiteness that would be more evident in other material. The color is almost pure blue and white, for Andrea was even more sparing in his use of color than was Luca. A duller blue is used for the cavern in the predella, the palm of martyrdom is green, and the details of drapery, halos, etc., are lightly gilt. The sense elements and the emotional are the notes of a chord sounded together. Certain qualities of form which very commonly exist before our eyes in actuality, yet are so embedded in coarser stuff that they escape our notice, are here refined from the accidental, and made clear to our appreciation, and likewise, certain qualities of character, beauties of holiness, are made clear to our apprehension, as it were the flowering to our inward eye of some sweet seed existent in humanity.

The later Della Robbias exceed the limit, first in introducing other colors in great masses which give a disgustingly crude effect, and also in departing from a simplicity of composition which included only a few figures and scanty accessories. When Giovanni makes an Adoration in which he tries to find place for the familiar properties of the contemporary painter, and, moreover, colors them to resemble a heap of winter vegetables, his art product is as far removed from Luca's as the squash is from the white rose.

CHAPTER VII

THE MINOR SCULPTORS OF THE EARLY RENAISSANCE

CHAPTER VII

THE MINOR SCULPTORS OF THE EARLY RENAISSANCE

THE MARBLE WORKERS

DONATELLO'S communication of vitalities, Ghiberti's gilded rhythms, Luca's blue and white divinations of the Hellenic, make us the richer by three individual habits of seeing form; but the works of the younger generation, of the minor sculptors, and speaking now more especially of the marble workers, are so much the product of one habit of sight that they continue us in the same mood with variation only of the subtlest, and might almost be, in effect upon us, the expression of one temperament. As the production of men of an equal calibre, who have been trained to an equal dexterity of hand, and who are working in the same spirit to meet the same ideal of taste, the work of the minor sculptors in marble bears the stamp of its period more obviously than does the work of the three master sculptors whose varying genius reacted against the same environment with distinctly individual results.

The same convulsion of the earth's surface forms the peaks and the foothills, but the winds and the streams of the heights will carve for each an individual profile, while the foothills will always resemble one another. As in a literary period marked as such by certain general characteristics, as for instance in that defined period of the Elizabethan dramatists, the time-spirit, so clearly present in the work of a Peel, a Greene, or a Nash as a shaping force, is to be traced in its Shakespeare as itself directed by his individual spirit, so the forces which but aid in the development of the great sculptors of this period have their own way in the moulding of the minor men. Donatello had his moments of caring for surface effect, and Ghiberti occupied himself often with decorative detail, and Luca is frequently content with merely facial expression of limited, quiet feeling. But these qualities found here and there in the masters' works, and included as elements of their effect, are the ever present and determining characteristics of the works of the minor sculptors. As a result, and with the marble workers especially in mind, one feels that the sense appeal of the many works is practically one and the same, and that the emotional appeal varies only by the slightly differing suggestions of portraits and of favorite types. And therefore the distinctive æsthetic appeal of the marbles of the Early Renaissance,

BENEDETTO DA MAIANO

PULPIT

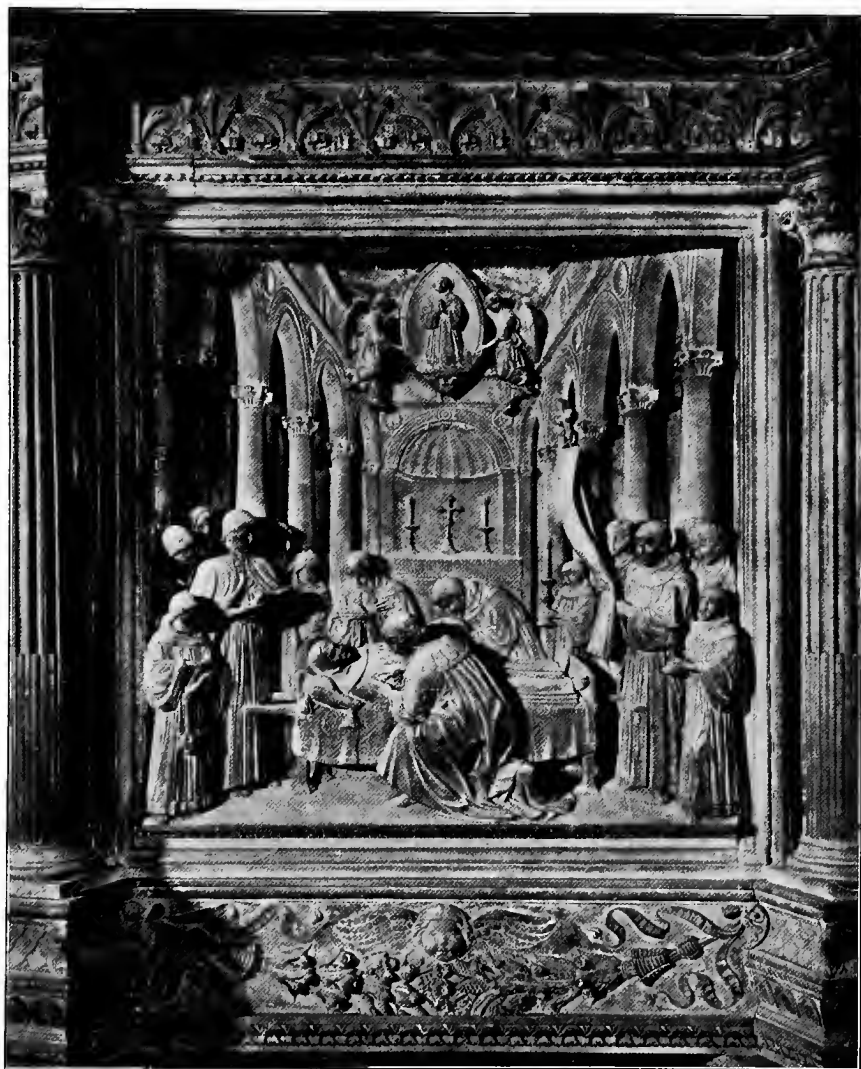

S. Croce, Florence

which, resulting from the harmonic treatment of light and shade, and from the selection of rarities of structure, is so productive of delicate imagined sensations and of lyric emotion, is found in its essential simplicity in the work of such men as Maiano, Desiderio, the Rossellini and Mino, and in what we have called the "originals" of the period, in the architectural decorative sculpture of pulpit and tomb, in the portrait, and in the relief.

Benedetto da Maiano, 1442-1497

Maiano's pulpit in Santa Croce is an epitome of the decorative values of marble carving. Its warm color, a coffee color with a pinkish suggestion, and the soft smooth appearance of its surface, obtained by both the mechanical treatment of the finely grained stone and also by the grades of relief of its carving, make it seem less a construction of marble than of some material akin to jade or ivory with all of their peculiar power of touch appeal to the skin. Considered architecturally, it has the studied elegance of proportion and the rhythm of structure which distinguish an artist's creation from a natural object, and in the impression which it makes of human intelligence behind effect it gives a meaning to the word "art." Its decorative plan makes it an elaborate frame and support for five panels in relief whose subjects are incidents in the

founding of the Franciscan order. As may be seen in the illustrations, the reliefs follow in narrative treatment the frescos of Ghirlandajo, and in technique they are related, in their picturesque quality, to the manner of Ghiberti, although a less skilful use of perspective results in less agreeability of illusion. The figures, clad in ungainly monk's robes, are good in attitude but deficient in interest, and while true to the monkish type are yet without personality. The intrinsic qualities of the reliefs are best discerned in the terracotta models now preserved at the South Kensington Museum, for in Santa Croce their values are much affected by their setting, and the mind refuses for long to consider them apart from it or as other than organic parts of a whole. Interest in them as illustration fades before the pleasure of running one's eye down the mouldings of the cornice, down the channel of a fluted column, along the flourishes of a console, and over the slant of the base to the attaching point on the great pier. And for the lateral glance there is first the flat frieze beneath the cornice whose repeating notes are the objects of the passion, and next the richer frieze below the panel with its effect of rounded fruits and cherubic faces. The recesses between the consoles have two sides embroidered in a flat floral pattern seen originally against a gilded background, and the third side is niched to receive a statuette of a virtue

DESIDERIO
TOMB MARSUPPINI
S. Croce, Florence

which in its finish and perfection is worthy of embodiment in a precious material.

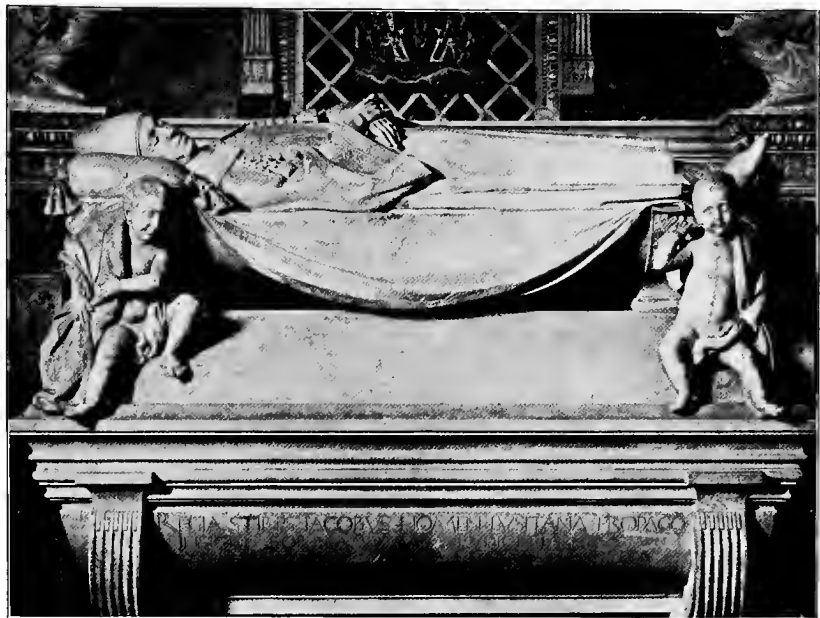

Desiderio da Settignano, 1428-1464

As faultless in architectural composition as Maiano's pulpit, but more original in its decorative surfaces and far more sculptural in its elements, is that tomb placed across the nave in Santa Croce, made for the Cardinal Marsuppini by Desiderio. Its figures are life-size and unusually well studied for tomb statuary. The slender children who support the armorial shields are not the ordinary boneless and characterless putti, and the youths above, who bear the garlands on their shoulders, are also uncommonly animated and realistic. The lunette with the Madonna and Child is unfortunately much in the shadow of the arch. But enough is seen to show qualities which remind one of Donatello's manner at its sweetest. The focus of the composition is the sarcophagus and effigy, the richness of which is emphasized against a plainly panelled background of dark porphyry. The light is reflected in many modulations from skilfully varied textures, from the waxen smoothness of the face and hands, from the flat stencilled-like surface of the stiff drapery of cloth of gold, from the scales forming the covered top of the sarcophagus, and from the foliated corners of the base. Other Renaissance tombs show mastery

of marble technique, and possess ornament and reliefs of much beauty; but no other equals Desiderio's masterpiece in giving an impression of a whole of which every part is original and charming.

Antonio Rossellino, 1427-1479

Even Rossellino's famous tomb of the young Cardinal of Portugal at San Miniato cannot, in composition and in ornamental detail, equal the merits of Desiderio's; but as often happens as compensation for unevenness of excellence, there is the emphasized appeal of a special quality. The special appeal is here, I think, to be found in the expressiveness of the figures, — an expressiveness not nearly so confined to facial meaning as was habitual with both contemporary sculptors and painters. For instance, the two angels who bear up the roundel of the Madonna advance with a swift action of the limbs, and there is a gayety of movement in the ripple of draperies and of extended wings which reënforces the expression of blithe agitation in their faces, and in the faces of the cherubim surrounding the relief. There is in their alertness a kinship to the expression of the infants of the sarcophagus, and even to that of the Madonna, whose downcast lids seem to veil an intelligence of glance belonging to a personality partially revealed by the half-smiling mouth. The animation, apparently so near the surface, of the

ANTONIO ROSSELLINO
TOMB CARDINAL OF PORTUGAL
S. Miniato, Florence

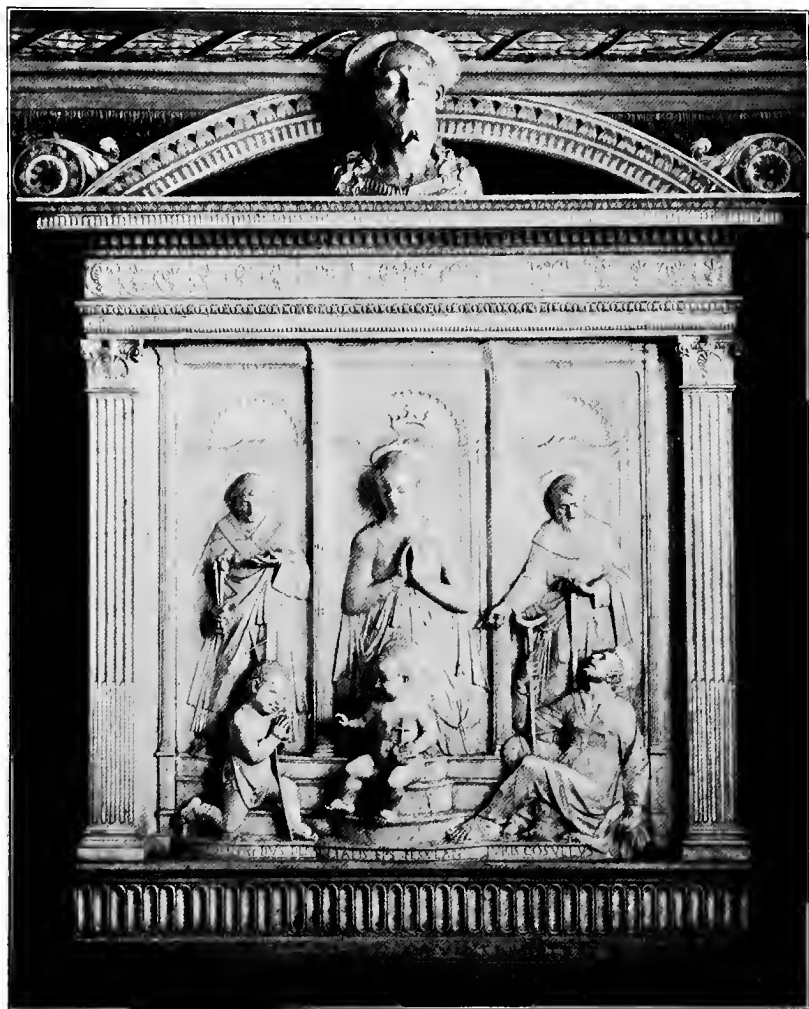

attendant figures but makes more impressive the stillness of the sepulchral figure from which the tide of thought and feeling has withdrawn into hidden depths. The repose of the figure is absolute. The folded hands are exquisitely modelled, as is also the face, with a feeling for that delicate bony structure which the eye delights to trace in emaciation and associates with the pathetic refinement of illness and the contemplative life. Scarcely a line marks the face, and its placidity accords well with our idea that death is the kindly blotter-out from the human countenance of all records of life's passions, and too with our fancy of the character of this virgin cardinal, who "lived the life, we may say, rather of an angel than a man." To the Christian no stronger symbol could be given of a spirit sealed in slumber to await its resurrection; and in showing impressively the dignity that the human body may express when freed of all the accidental agitations of life, it suggests equally noble possibilities to be obtained by the human spirit in less troubled spheres.

Mino da Fiesole, 1430-1484

Of all the minor sculptors, the name of Mino is most familiar, made so by the number of works attributed to him rather than by their surpassing excellence. In fact Mino was overburdened with commissions, and, as often follows popularity, much of the sculpture called

his is the product of his atelier. If he be judged by striking a balance of his many works, he could not rank with the Rossellini, or with Desiderio, or with Civitali, for his work is very uneven in value. At its worst it is insipid and stupid. But at its best it has a sweet distinction of technique and of type which, in this age of lyric sculpture, gives it the place due to exquisite expression of refined, if limited, sentiment.

Mino's forte was the amalgamation of sculpture, preferably basso rilievo, with architectural elements, using such nicety of taste that the monument or altar so made is not sculpture framed, nor a small façade decorated with sculpture, but has the true artistic unity of a poem or of a musical composition. The altar at Fiesole, although an early work, is evidently one upon which he worked with care, and achieved an exquisite result as compact as a sonnet. It is made of a milky marble of fine grain treated with the waxy finish characteristic of Mino, and unstained by incense as it is, the full value of its delicate carving and channelling may be appreciated. The figures, with the exception of the two infants, the Christ and the little St. John which are in the round, are modelled with much accuracy and grace, but there has been little attempt to realize the figures as figures. The heads and the hands indeed have been carefully treated for expressive value, but the bodies are only suggested

MINO DA FIESOLE
THE MADONNA AND SAINTS
Cathedral, Fiesole

MINO DA FIESOLE
MADONNA. BUST OF A WOMAN
Ravenna, Florence

enough to make plausible the draperies and the attachment of heads and hands. The Madonna is planned on a larger scale than are the attendant saints, but her kneeling attitude of adoration lessens the unpleasantness of resulting effect. The droop of the head, showing thereby the eyelids and the forehead and the hair with its pointed fillet of pearls, comes with Mino to be like a favorite cadence in a poet's lines.

It is a cadence repeated in the relief of the Madonna of the Bargello, which, whether actually from Mino's chisel or not, has the charm of his types in the arched brows, the curve of the drooped lids, the cleft chin, and the strangely contrasting blunted ears. The head is set rather haughtily upon a long neck whose lines flow gracefully into the outline of shoulders not too correctly modelled. The child is in high relief, its feet projecting beyond the frame. The finish of the nude is exquisite, and the long slender hands rest upon the child's body with pleasant pressure. The drapery suggests, as is usual with Mino, some pliant stuff with peculiar wrinkles and shallow folds. Its border of gold holds it to the gilded background and the frame, against which the relief, with its satiny finish, reminds one of a dimmed pearl in a setting of tarnished gold.

In the same room at the Bargello are several fine specimens of Mino's work in low relief. The Bust

of a Woman is remarkable for the richness of effect and of personality obtained from low relief. The face, to be sure, although well modelled and with all the truth to nature which makes Florentine portraiture of the fifteenth century what it is, has more subtlety of finish than of modelling. And to the representation of the richly embroidered gown and the carefully arranged hair, Mino has devoted much thought, treating them as important elements in a composition of surfaces.

Stronger work in portraiture exists in connection with the tombs of the Badia by which he is perhaps most fairly to be estimated, although in the decorative parts there is a certain monotony, a repetition of motives which makes the remembrance of Mino easy and yet which becomes a tiresome reminder in his poorer work.

THE BRONZE WORKERS

The difference in the vigor and realism of the contemporary bronzes when compared with the rather languid sweetness of the marbles is not fully accounted for by the explanation that the workers in bronze, Verrocchio and the Pollajuoli for instance, were of that energetic temperament which finds its interest in the harder problems of that material and of naturalism, in distinction from temperaments such as Mino's, which, with the classic sense of restraint strong upon it, is

content to limit its field to a small cycle of sentiments. That difference is further explained by the fact that each material has peculiar possibilities of appeal,—a fact too often lost sight of since the Renaissance when the masters had a comprehension and mastery of the effects proper to each. With the marble workers it is as if the translucent material itself lured them into a technique and even into a conception of their subjects especially fitted to bring out the surface possibilities of their material. The surface effects to be obtained in bronze are different, and in comparison meagre. The effects of gilding and of patina are at the mercy of time. Such effect as is gained by decorative detail is that of clarity of design and silhouette. Finally, as regards the figure, that field of achievement in bronze which only the masters are able to conquer, the essential appeal, is that of structure and action, of bones and muscles, and therefore, while in good work the invigorating quality is direct and delightful, in weak work there is little opportunity to balance defects of structure and action by clever treatment of flesh, skin, and drapery. The contours of superfluous flesh, any effect of softness of surface, is not pleasant in bronze. Sagging cheeks and double chins, which in marble are not unpleasant as values in the light and shade scheme of a portrait bust, appear in bronze as petrified deformities.

Andrea del Verrocchio, 1435-1488

Bearing in mind then that bronze as an artistic material seconds the sculptor in representing the bony structure of the human figure bound together as it is and moved by its covering muscles, a representation in art which we enjoy because it suggests sensations of body which are among the most direct of which we are conscious, we are much better equipped for the enjoyment of such a bronze as Verrocchio's David than are critics whose faint praise includes such statements as this of Symonds: "As a faithful portrait of the first Florentine prentice who came to hand, this statue might have merit but for the awkward cuirass and kilt that partly drape the figure," or this of Scott: "Scriptural tradition is defied by his being represented in a corselet; and the left hand resting on the hip gives a flippant attitude, very much at variance with the subject." This offending corselet, which adds to the sin of awkwardness a defiance of "scriptural tradition," is, nevertheless, very well in accord with artistic tradition which sanctions the use of drapery for its contrast with the nude, a contrast made in this case by the chased borders and ornamental work of the slight armor, which serves also another artistic merit in that it rather emphasizes than conceals the action of the torso. That the action of the hip can be so

VERROCCHIO
DAVID
Bargello, Florence

clearly understood under the "kilt," gives even that awkward garment an artistic value. The "flippant" attitude of the left hand may be forgotten in noting its perfect modelling. The right hand grasps the sword with a force that seems really to extend through the muscles of the forearm, and although "the arms are the lean, veined arms of a stone-hewer or gold-beater," the slender well-knit legs have in their easy action all the grace possible to youth. The giant's head in collapse at the boy's feet is, despite its technical merit, the most unpleasantly realistic note in the whole, since it fails to stir the imagination. That power is monopolized by the head of the David, whose face is the first appearance in art of that type of potent suggestion which Verrocchio first dreamed, and which later haunts the works of his pupils, Leonardo and Lorenzo di Credi. The fascination of its enigmatical expression is alone able to hold one before the statue for more than a passing glance.

And when one is also so fortunate as to be able to feel the pleasure that comes from seeing the common from an uncommon standpoint, a form of æsthetic appeal which has been since the Dutch masters the very backbone of a school of painting, and when one can therefore obtain from the artist's representation, from his synthesis and emphasis, an enjoyment which the natural object represented would

utterly fail to stimulate, he will find himself considering this small bronze David to be one of the most charming statues of the Renaissance, and quite sufficient to prove Verrocchio a bronze master of the first order without even the witness of that famous equestrian statue in Venice which will be noticed later.

Antonio Pollajuolo, 1429-1498

As Verrocchio, his contemporary Pollajuolo was worker in metals, painter, and sculptor, and devoted to the scientific side of art, but unlike Verrocchio his eagerness to extend the realistic powers of sculpture was not accompanied by a keen sense for the beautiful as existent in the actual.

His two masterpieces, the tombs of Innocent VIII and of Sixtus IV, in St. Peter's, at Rome, are both badly lighted and unfortunately placed. The details are practically inaccessible to the eye, and the general impression produced is more one of admiration for the sculptor, who in an epoch of shallow carving could plan such ensembles and so successfully cast both figures and reliefs, than of pleasure in the contemplation of the works themselves. The few pieces of the Bargello afford one a better idea of the qualities of vigor and boldness present in Pollajuolo's characteristic style. The terra-cotta Bust of a Young Warrior is most attractive in its portrayal of youthful fire and pride.

The little bronze of Hercules strangling Cacus, while too harshly realistic and scientific to be wholly pleasant, is interesting as typical of that strenuous and bold endeavor after accuracy in representation which relates the minor bronzists to the great masters of the Early Renaissance, and makes clear in what manner the fifteenth century built a foundation upon which rests that facility of representation which marks the century to follow, makes of it another epoch, to which is given the title of the "Late Renaissance."

PART II

THE LATE RENAISSANCE

CHAPTER I

THE CHARACTERISTICS OF THE LATE RENAISSANCE

CHAPTER I

THE CHARACTERISTICS OF THE LATE RENAISSANCE

(1500-1600)

THE use by historians of the qualifying adjectives "Early" and "Late" to designate Renaissance art of the fifteenth and sixteenth centuries respectively indicates not only a recognized progression in time, with its inevitable difference in product, but it implies as well a recognition of the presence, in the art activity of the Renaissance, of processes of growth, culmination, and decay, similar to those so often traced in the regions of its literature and politics.

The linking together, however, of manifestations of artistic power into a progressive series is a delicate and difficult task. For the work of art is double-faced: it presents itself to us objectively as expression and subjectively as impression, and, while it has its place as factor in a progression in the growth of power to represent, it is also typical of one stage in the growth of the power to please, and, as with the parts of a reversible puzzle, each piece has its differ-

ent function in two designs, and each face its fixed place in one design. If we choose to follow on the fabric of Renaissance art the pattern woven also into literature and politics, we must look at it from only one side, must find which aspect of the works of art under consideration, the objective or the subjective, will illustrate our preconception of development.

That, on the subjective side, we shall not be able to trace successive stages of growth, of culmination, and of decay in æsthetic appeal requires no demonstration, since æsthetic values vary with the individual and with the age. There will always be temperaments which gain more pleasure from Ghiberti's suavity than from Michelangelo's *terribilità*, and which in imagined sensation find the rude uncertain force of Della Quercia's Adam more stimulating than the perfect muscular adjustment of the famous Mercury, and such ages as our own, which, with its craving for the vague, finds in the very incompleteness of undeveloped technique a stimulus more pleasant than is the satisfaction in adequate expression of idea, and which rather prefers to expand in imagination the suggestions of a Mino than to rest in the achieved sweetness of a Raphael or a Sansovino. Obviously then it is not the power to please, which, in Renaissance sculpture, can be followed in orderly growth from blade to fruit, and through ripening to decay.

Our purpose, rather, is to trace the development of a power which is under no circumstances to be confused with the power to please by one who values his æsthetic salvation and which has its logical plan of progression, namely, the power to represent. That is, it is the development of the power to put before us accurately and correctly such facts and relations of form as express to us recognizable conceptions whose course may be symbolized by a line which rises steadily to its climax to descend again, and which, in its comparatively short extent, is so remarkably inclusive of the successive moments in the evolution of man's power to represent form that it affords a concrete instance of the working of general laws. For, in general, the power to represent form has its logical development in the race as in the individual. Both the child and the savage are strangely enough content with the abstract symbol which represents the idea of form to the mind rather than the form itself to the eye. Advance over the symbol comes, in the experience of the student of to-day who follows a beaten track as in the experience of the many individuals of past ages who opened out that track, by the gradual mastery of nature's combinations as presented to the eye in separate instances, and results naturally in an art of crude naturalism in which the actual model is reproduced with as much slavish exactness as skill of hand permits, unsynthesized, and

without showing conscious emphasis upon this part or that. Mastery of the laws of nature's combinations follows, and, whether a conscious working possession or not, its acquirement, as individual or racial attainment, both precedes the power to see and to represent the significant in the special model, and is a necessary concomitant of the highest degree of power, the ability to create the ideally significant form.

Along such general lines of evolution of technical power will the sculpture of any period proceed, making such deflections as the forces of its environment direct, and to such a course did the advance of Renaissance sculpture conform, displaying a swiftness in its movement, a luxuriance in its growth, and a variety in its product due without doubt to the vigor of those two influences which have before been mentioned as the shaping agents in the art activity of the period, that is, to the enthusiasm for nature and the enthusiasm for antiquity. Casting aside Byzantine symbolism, sculpture in the hands of Niccola Pisano replaced the conventional symbols of form by actual imitation of forms, guided in its choice of copy by Niccola's predilection for the antique, and passing by the aid of Giovanni to the study of the living model. The imitation of nature thus inaugurated does not develop into a crude naturalism as it might have done had the enthusiasm for antiquity not been coexistent with

the enthusiasm for nature. Instead of such result, there is, throughout the entire first century of the Renaissance, an action and reaction of the two influences upon each other which greatly accelerates intelligent and correct representation. From the study of anatomy and from the observation of the living model, the sculptor learns facts of structure and of action, while his tendency to imitate the individual and often ugly proportions of his model is checked by his appreciation of the greater harmony of classic proportions as seen in the few antique statues that he knows, and there is formed, therefore, the habit of selecting and of modifying parts as a means of obtaining the greatest harmony that the actual permits. There is reached then, in the works of the Early Renaissance, that state in the representation of objects wherein it appears that the sculptor has learned to present a synthesis of the significant and beautiful as found within the limits of the actual; while in the works of the masters, although seen less characteristically in Donatello than in Ghiberti and in Luca, appears a care to select ideal proportions, a care which becomes the special problem of the masters of the next century. For its solution there is at hand aid too importunate to be overlooked. Lorenzo de' Medici has opened his garden gallery of antiques. On every side there are growing collections of classic art and discussion of its canons. Instead

then of passing through an experimental period in seeking for the general laws of a pleasant artistic proportion, the sculptor adopts those which he can deduce from his classic model, and which have not only the authority of the scholars, but have also the sanction of his own half-Latin senses. And it is by reason of his clever amalgamation of the facts of classic proportion and method with the facts accumulated by the study of nature, that the sculpture of the early sixteenth century differs so widely from that of the fifteenth, and that nudes such, for instance, as Donatello's David and Giovanni da Bologna's Mercury, could never change places with each other chronologically. Having mastered both nature's laws of structure and action, and the classic laws of proportion and pose, those masters of the Late Renaissance before Michelangelo and those later men who are unswerved by his influence show themselves desirous and able to create figures which unite with the living quality of forms imitated from the individual the harmony of proportion found in the scale of parts adopted from the classic. Had the genius of Michelangelo not upburst into sculpture, there might have been from this point a gradual development of a type wholly national, but in Michelangelo are achieved the results of generations of ordinary striving. His genius leaps to that culminating point in the representation of form where it is

possible to create figures of the highest expressive value, which are ideal in proportion and even in structure, and which, without breaking nature's laws, extend them to combinations which are not nature's, but are the creations of the sculptor.

In Michelangelo, the enthusiasm for nature and the enthusiasm for antiquity which had combined to shape Tuscan art are fused to feed the flame of his genius, and appear no longer as living forces in sculpture. Enthusiasm for Michelangelo takes their place, and decay in the representation of form is rapid. The art of relief is quite lost, and in statue-making, the mannerists of the last years of the sixteenth century no longer study for themselves either nature or the antique, and in their ignorance of underlying law are as incapable of putting together coherently the facts that they copy from Michelangelo as is a child, too young to speak his own tongue, of forming into words the letters of a foreign alphabet.

While as a direct influence in representation, the enthusiasm for the classic cannot be traced in the sculpture of the Late Renaissance after imitation of Michelangelo set in, yet as an indirect influence in determining the subject and the spirit of conception, it has supreme sway from the beginning of the century until far past its close. The formal subjects of a period are naturally, in greater or less degree, deter-

mined by art patronage, and, historians affirm, are illustrative of the mental fashions of their times. The classical, mythological, and allegorical figures of Late Renaissance sculpture are meant to body forth in visible substance the characters with which devotion to the Latin authors has peopled the popular mind. Whether its patrons be princes, citizens, or ecclesiastics, whether its destination be church, or public piazza, or private palace, it must meet the demand for classic or allegorical subject. Given, in the names that this sculpture bears, its formal subjects, shall we find them coincident with the direct subjects as apprehended through our senses? In the least intelligent productions, whatever their titles and the conscious intention of the sculptor, the senses feel the direct subject to be a discordant jumble of echoes, and the mind defines it as an inarticulate mumbling of classic ideas. In the best work, however, the rapport between the classic formal subject and the direct subject is within a certain limit perfect. For, so far as the direct subject is an expression of an unspiritualized joy in the natural life of the senses, it is an expression of an element that had its prominent place in the Latin ideal, and the figures created, as "genial seed-bearing vessels of nature," are true to the conceptions of both epochs. For the richest and fullest expression in Renaissance art of this pagan feeling,

an expression struck out when Renaissance and Latin paganism were most truly identical, one must go to Venetian painting, to find there the splendid portrayal of "the lust of the eye and the pride of life." Yet in some of its aspects it is not inadequately treated in sculpture, and indeed is the theme of the best work accomplished by the Late Renaissance sculptors, excepting of course Michelangelo, and in fact is what the sculpture of the period expresses to us when it is sufficiently coherent to express anything. It gives its charm to the great output of decorative sculpture. It animates a whole host of satyrs, and nymphs, and grotesque godlings, who ornament palaces and squares, and dwell in fountains and gardens.

Because circumstances imposed the classical subject upon the sculptors of this period, and because, despite a knowledge of the ideals and practices of the ancients, they were unable to reproduce them in art, except as some residue of their composing elements survived and existed in the racial temperament, there was fostered a spirit which left its traces on the sculpture of the times, and detracts from its æsthetic value.

For the sculptor works no longer in that free spirit of youth, which, raising the altar of its devotion to the unknown beauty, accepts what thrills its senses in the world about as revelation of that beauty, as a fragment of a beautiful whole believed in if not yet

seen in its wholeness, and worthy his attention and imitation. With maturity has come the comprehension of the discovered standards of classic beauty. He is by nature, as a lineal descendant from the Latins, disposed to find those standards adequate. Moreover, he is forced to conform to them by the pressure of the culture of his day, which accepts them as authoritative, and he is no longer free, nor has the wish, to express empirical knowledge of the beautiful, except such as is in accord with the accepted standard. Therefore it comes to pass that he is filled, not with the desire of beauty, but with the desire of classic beauty. In contrast with the intellectuality and sensibility of the Early Renaissance, it seems as if the Late Renaissance did not think, it merely adapted thought; it did not feel, it appropriated the masks of classic feeling. And hence there is an element of insincerity and of self-consciousness in much of the work of this period which diminishes its æsthetic appeal, since we feel that the sculptor is straining to conform to a standard that he but dimly understands. Moreover, since personal preference is barred out in the creation of types of general beauty, there is an absence of that naïve self-revelation which, as the suggestive quality in fifteenth-century sculpture, made it possible for us to share in individual visions. Yet, when he is master of his idea, his technical ability enables him

to express it with a clearness and exactness truly sculpturesque. When genuine feeling swallows self-consciousness, and he dares to express himself, his work is conceived with a boldness and a joy which give to it, whatever its subject, a high æsthetic value in and for itself; and which, whatever its shortcomings as an interpretation of classic subject, endows it with more merit as the æsthetic expression of at least one aspect of the Latin ideal than has often been recognized, although one might think that the present generation, so eager in its wish to restore to physical life its lost dignity, would be more responsive to the appeal.

And yet we happen to be somewhat unfortunately placed for the appreciation of this comparatively small part of the body of historical sculpture, for several circumstances have prevented us from giving it that degree of attention which is necessary for vivid sensation. For our inheritance of "classic" sculpture, ranging from the early Greek to the latest "revival," is appallingly large. Nor is it to be expected that our eyes, opened as they have been to the glories of the fifth-century Greek sculpture, should look upon these few classically inspired statues of the Renaissance, in so far as they are meant to be interpretations of antiquity, as other than empty husks, which hold never a kernel.

Although we are afar off from the Hellenic tempera-

ment, and have to our prophets, instead of a Wincklemann, a Lessing, a Goethe, a Keats, who without seeing have divined the Greek ideal, archæologists who give us facts and fragments, yet because, owing to their labors, our eyes have seen the actual work of Phidias, we have felt in fuller measure than any previous century the physical and spiritual exaltation of the Greek conceptions as made corporeal in sculpture. It is not then to the Renaissance but to the Greek that we go if we seek the refreshment of the antique ideal. As regards the great mass of Roman art, which is to the Greek the coarsened and inadequate rendering of a poet's discourse by the man in the street, we of necessity discriminate, prizing much of it as hints of Greek originals, broken reflections of what has been lost to sight, and finding it not the least wearisome, paradoxically enough, when it is least Greek, when it shows itself most blind to the subtlety of Greek proportions and is perhaps vulgar, but alive and Roman. Now the pseudo-classic sculpture of the eighteenth century neither voices the real passions of its day nor echoes the beauty of lost antiques, and therefore is it a burden on our eyelids. Cold, academic, meaningless except to the historian and the pedant, it truly encumbers the earth; and even in Italy itself it suffocates with its presence sculpture, which, generated it would superficially seem, by the same standards of form,

yet had the advantage to be born alive, with the life current of its own times to make it individual and real, if not classic.

Could we purge our eyes of their memories and look upon Sansovino's Bacchus or upon the flying Mercury as did the Florentines who saw them first, we should no doubt respond with an excitement and surprise as keen as theirs to the novel appeal of unexaggerated action and structure so clearly felt from the nude, and seeming to at last give form to the dreams of study.

Moreover, not only does the accumulation of sculpture patterned after the classic make us inattentive to the Late Renaissance sculpture as one interpretation more, but we are prevented from fully appreciating the intrinsic æsthetic value which its figures possess as artistic creations by the peculiar bias of the modern temperament. The temperament of the sixteenth century with its absorption and delight in the representation of *un beau corps nu* found in them a representation of form by far the most satisfactory and stimulating that it had seen, and found there, too, the illustration of its fondest ideal of man as a being free, dignified, self-sufficient for the world that he lives in. Qualities of order, of balance, and of sanity, so new to him in art, are to us the catalogued beauties of an old enthusiasm. They leave our imagination

unstirred. Half living as we can through the means that science and history have given us, a hundred different lives of the imagination, we are most easily thrilled in art by that which suggests rather than defines, which, instead of confining us to a definite feeling, a recognizable and therefore limited sensation, sets fire to trains of fancy and starts the nerves into a vague quiver which promises, if it does not provide, rare sensations.

In short, the greatest fault to be found with this sculpture as a whole, excepting of course with the work of Michelangelo, is that for us, from an æsthetic point of view, it is completely lacking in that "charm," for which our appetite is omnivorous. It is true that its mastery of technique enables it to express its thought fully and clearly. But we are not at all moved by that thought. And moreover its greatest merit sculpturally, its restraint and its scrupulous rejection of extraneous matter, is for us a demerit since it lessens our chance of æsthetic enjoyment as we can find no avenues of escape into associated fields of our own imagining. Finally, we may be sensitive to its æsthetic appeal and obtain the æsthetic pleasure that it can give, if, non-expectant of participation through imagined sensation in the Greek life of poetically conceived sensation, we can key ourselves to joy in the exuberance of unsated, unmoralized sense life, and, resigning the

dear delights of diffusive emotion induced by promises of sensations, are content to identify ourselves with simple action and submerge ourselves in one state of sensation.

It is plain enough that the sculpture of Michelangelo carries us into realms of feeling and thought which are immeasurably distant from the confines of the limited mood which is typical of the Late Renaissance when not under his spell. The æsthetic appeal of his creations will be considered later. His contemporaries, with the exceptions of Cellini and of Giovanni da Bologna, were dazzled by his genius, and the works of the masters who had preceded him came to be noticed no more than are the stars after the sun has risen. They have failed also to have any appreciable effect upon the style of modern sculpture, which, susceptible to the charm of the Early Renaissance and studious of the methods of Michelangelo, has found little to attract it in the period between. That period created no new things in sculpture, and is to be valued historically for its excellent technique, and as the last sincere expression in sculpture of unashamed, unphilosophized absorption in the sensuous life.

CHAPTER II

THE SANSOVINI

CHAPTER II

THE SANSOVINI

Andrea Sansovino, 1460-1529

STANDING between those chronological groups of works of art, which, because of marked common characteristics, are said to constitute a "period," there are always to be found so-called "transitional" works which bear on their surface reflections of the period which disappears, and foregleams of that which comes. As both postlude and prelude, such work is the especial delight of the scientific art critic whose business lies with the construing of resemblances into relations. Outside of its interest, however, unless the union of new and old is unusually piquant, transitional work has not the æsthetic value possessed by the representative work of a period. It is apt to be reminiscent without spontaneity, and tentative without conviction.

While in Andrea Sansovino, in whom is traceable the transition from the Early to the Late Renaissance ideal of form, there is not the originality and energy

of artistic power to make for piquancy of effect, there is on the other hand a natural disposition toward an ordered and general beauty which gives him firm hold upon the classic manner. In his early works he joins hands, loosely enough, with the fifteenth-century Florentines; but in his last works he is at one with the sixteenth century in spirit and type. He is clearly transitional in the great tombs of Santa Maria del Popolo in Rome, the masterpieces of his maturity, and invites comparison of the manner of the two periods, since there he is treating an old object of the Early Renaissance, namely, the architectural sculptural monument, in the new manner of the sixteenth century.

It is unfortunate for the purposes of comparison that there are not in Santa Maria del Popolo any typical Early tombs. Passing down the church, one notes some of Mino's stupidest, most barren work, and has thrust upon one's notice Bernini's restless saints, all of a frozen flutter in the nave, and finally comes to Sansovino's tombs enclosed in the choir behind the high altar, in the mood to feel that they are stately monuments of a well-ordered elegance. One's feeling of satisfaction, however, is but too short-lived, for the tombs themselves revive memories of the tombs of the early men, of Desiderio and Civitali, and Rossellino; and such memories convince us that we shall not get

ANDREA SANSOVINO
TOMB CARDINAL SFORZA
S. Maria del Popolo, Rome

an equal pleasure here. Analysis of the effects of the parts brings out the reasons for the emptiness of the whole impression. The arched recess, that principal feature in the plan of the Early Renaissance tomb, has been expanded here into a petite façade, broken with projections and recesses, holding free statues in its niches, and covered with a veil of fine ornament. The monument is, architecturally, put together with good taste in the use of classic members and mouldings, but with an absence of focus. This defect, moreover, is in no degree mitigated by the distribution of the ornament, which, while in itself of much beauty of design, is ineffectual in its application since it does not emphasize the structure, nor serve to give calculated values in the light and shade scheme of the whole composition. Evidently the sculptor has not had in mind the old idea of the construction of a frame properly subordinated in structural and decorative effect to the central sarcophagus. Indeed, the effigy of the dead and the roundel of the Madonna, upon which were once concentrated the attention, are here but pale gleams from the past, and are quite lost to notice in the glory of the niched figures, which, from the care bestowed upon them and the prominence given them, are surely the foci of the monuments. They are unequivocally of the Late Renaissance in type, and no doubt their ease of pose and their ampli-

tude of proportion, as well as their grace of drapery and regularity of feature, gave much real æsthetic pleasure to their day. But they exert over us no spell of the novel, and, lacking in our eyes both the subtlety and the intellectual content of the antique, lacking also the suggestiveness of the individual, their "catalogued beauties" fail to charm.

The figure of Prudence on the tomb of the Cardinal Sforza is sometimes said to be one of the most beautiful figures of the Renaissance. The eye acknowledges the excellence of the representation of an evenly developed female type, but counts its æsthetic appeal as nil beside the feeling induced by Della Quercia's incorrect but stimulating nudes, Duccio's figures, unsubstantial but alluringly draped, or even beside the charm of Mino's curving eyelids. Identify yourself with it, there is nothing represented in its action, or in its character, or in its physical life to give higher quality to your moments.

None of the figures has any connection with the others as a member of a group, nor with the sepulchral figure which itself is not, either in sentiment or in composition, the keynote of such an elegy in stone as Rossellino and Desiderio could compose. Misled, perhaps by a desire for novelty, in the treatment of the sepulchral figure Andrea has achieved signally unhappy results. Abandoning the traditional outstretched pos-

ANDREA SANSOVINO
DETAIL "PRUDENCE"
Tomb Cardinal Sforza

ture, he has here represented the figures as half reclining, leaning on their elbows and with their legs crossed, yet with neither the decent composure of the dead nor the animation of the living, so that the hybrid attitude is, physically, most painful to the spectator, while it drives from his mind those sentiments wont to hover near the thought of death, and which are so easily respondent to any poetic treatment of the theme.

Jacopo Sansovino, 1477-1570

In emphasizing in Andrea Sansovino a lack of poetical sentiment as typical of the sixteenth century in comparison with the fifteenth, there comes, to qualify any too sweeping a generalization, the thought of Andrea's closest pupil, that Jacopo Tatti called Sansovino from his master, the body of whose production, to be sure, goes to swell the great pæan on the splendid joys of living which Venice gave the last years of the century, yet who, before he went to Venice, made in Florence a statue of Bacchus which is a perfectly rounded stanza of the "poetry of earth" which "is never dead."

The Bacchus is a statue, under life size, of slightly yellowed marble, showing little *morbidezza* in the treatment of its surface and little detail in the modeling. There is no distinction in the forms except in

those of the face. The balance of the members and their proportions are evidently inspired by the classic, yet the whole figure moves with the living rhythm of an individual. Indeed, so real is its communication of movement, that it is almost possible in imagined sensation to feel in oneself that smooth muscular adjustment which we call perfect grace. What pleasure, as of embodying in muscular movement a cadence of music, to sway forward with the weight on one side, while at the same time the leg muscles on the other side gently straighten, and the balancing arm circles upward toward the lifted head! Sansovino has represented the pleasantest moment of that action, the moment that holds in itself the inevitable suggestion of the muscular sensations that preceded it, and even suggests, in the expectant joy written on the face, the sensations to follow as the polished cup shall touch the lips and the wine flood the sense with gracious warmth. And to such imagined sensation the mind is quick to fit a concept of the "pure joys of living." So long as we can dwell with pleasure on that idea, and so long as in imagination we can submerge our physical feeling in the life current which pulses in the Bacchus, so long will the statue hold us. For its æsthetic appeal lies in its power to give us that thought and that feeling, and it is not adulterated nor even perceptibly extended by associative values, either mythological or

JACOPO SANSOVINO

BACCHUS

Bargello, Florence

historical. As an interpretation of its subject, it is sincere because it is no echo of ancient feeling, but is the embodiment of the temperate Italian's enjoyment of good wine, and of his happiness in his vineyards. This young god is not Greek nor Roman, but pure Tuscan, the concentration into concrete, tangible vision of what is rendered to the senses in a Tuscan vineyard, a being who incorporates into leaf-crowned form the grace of the festooned vines, and seemingly into his structure that very sweetness and warmth of sun and soil which swells the purple grapes with nectar. One *nuance* he is of the Greek Dionysos, but only a flash, as it were, of that prismatic religious concept, of that cult to which each early people of Greece added its local color, until, poetized and philosophized, it held in any one of its symbols the recognition of the life generated from the earth by sun and dew, and of the essential oneness of such phenomena with the less clearly discerned changes in man's state as body and soul. Yet the suggestion here for such associative idea is of the slightest. And there is no hint of the Roman patron of orgy. His only attendant is a baby Pan. It is later, in Venetian painting, that the Bacchus of Latin poetry appears, and brings with him all his train of revellers. The Bacchus of Sansovino is, after all, less classic in matter than in manner, for it is not the interpretation of a Greek or a Roman myth, but is

actual myth-making from home-grown stuff, and it presents a nature incarnation with a clearness of outline and an exclusiveness of association which is truly sculptural and creates for the spectator a concrete sensation and emotion.

CHAPTER III

GIOVANNI DA BOLOGNA

CHAPTER III

GIOVANNI DA BOLOGNA

(1530-1608)

THE power to think sculpturally, to see a definite idea incorporated in a form which is the distillation of all those related sensations which make the idea, a power which the Greeks possessed in the highest imaginable degree, and which belongs also in generous measure to the best sculptors of the Late Renaissance, although it is unfortunately exercised on a body of shallow ideas, finds no better representative in this period than Giovanni da Bologna. Although a contemporary of Michelangelo, he is little affected by the latter's technique, and not at all by his thought, and makes his own figures the embodiment of rather obvious ideas, which are usually those of physical state and action.

His masterpiece, a thing, as the Italian says, "*molto ingegnosa e varrissima*," is the bronze Mercury of the Bargello. From all the shapes, which, shifting quick-silver-like, belong to the Greek Hermes of the many epithets, and to the Roman Mercury, god of gain and

eloquence, Giovanni has made choice of one, of Hermes Diàkteros, who is Mercury the messenger of the gods, known by his attributes, the petasus and the caduceus and the winged feet; and of all the god's possibilities of action, he has chosen the power of swift movement through the air. The figure, in fact, sums up for the eye the bodily sensations of the ideal runner, adding to our realization some indescribable element of enjoyment such as the eye seizes for us from the flight of a bird and the swoop of a yacht. For Giovanni has represented that moment, in the rhythm of running, when the wave of motion passes from one set of levers to the other, and the exhilaration of the effort is at its highest. And he has been able to isolate his chosen moment by means of his knowledge of anatomy, and his skill in the balancing and casting of bronze figures. The body as a whole is charged with the idea, and the head is made no more expressive than the foot, indeed is, as is the pedestal, merely a necessary termination. The relation of the arms to the action of the legs is perhaps somewhat artificial, too evidently determined by the idea of *contrapposto*, and could hardly be justified by any instantaneous photograph of the running movement; but, seen in silhouette, it adds to the impression of forward-upward motion, and the pose as a whole is a synthesis of the running movement which we readily accept as true. The modelling is suited to

GIOVANNI DA BOLOGNA
MERCURY

both the material and the subject by its clear indication of structure and muscles, and by its avoidance of any surplusage of flesh. The patina, of a myrtle green color, which has formed on the cheek and upper legs, is not unpleasing in effect, and is altogether a less regrettable souvenir of the figure's sojourn in the garden of the Villa Medici at Rome than are the scars marking where the statue was broken in its careless transportation to Florence.

On the old site of the Mercury in the garden of the Villa Medici, now occupied by the French Academy, there stands a replica with its surface corroded to the bright green tint fancied by modern Italians. It is only a copy, but, taken in connection with its situation, it teaches us how the enjoyment of an object is enhanced and prolonged by appropriate surroundings. The Mercury of the Bargello, confined with scores of other statues in the gloomy prison of the ancient state, was created, it seems, for the open air and the delightful freedom of a garden. His part there is played by a replica, but, so far as general impression is concerned, with slight loss to us. Entering the garden at the side, one passes down alleys bordered with box and filled with a pale green light which filters through overhanging ilex, and bay, and pine, and as one approaches the lawn before the villa, one sees there a flash of green flame, the Mercury, and perceives on coming nearer that he faces the open-

ing of the high terrace, and that space is clear before the speed of his feet across gardens and city walls to the azure Alban hills and the snow peaks of the Apennines.

Although Giovanni had not always the success in fusing subject with material which makes the Mercury his masterpiece, he is preëminently a bronze master, fond of energetic action, of epigrammatic contours, and of all the problems that find their best solution in that material. Yet he could work in marble. Indeed, it is said that he made the marble group known as the Rape of the Sabine, to prove that the fragility of the marble was no bar to the force and fashion of his skill. He convinced his public. For the science displayed in his group was keenly appreciated by his times, which it seems found pleasure in discussing technique much as it is discussed in the art schools of to-day, and so well did he hit off the popular taste, its worship in art of *un beau corps nu*, its liking for stimulating forms, that praises were lavished upon him, and the laudatory verses attached, as was then the ingenuous custom, to the group itself, were sufficient to make a printed volume. In their prodigious effusion of sentiment and superlatives, they seem a reproach to the laconic guide-book and the calm critic of to-day; but the group, in its solution of technical problems, is really rather "art for the artist" than a

GIOVANNI DA BOLOGNA

RAPE OF THE SABINES

Loggia de' Lanzi, Florence

satisfaction for the ordinary visitor. And that the sculptors have studied it with both pleasure and profit is evident from the number of groups, especially in France, which have been inspired by it. Yet even the unprofessional who give it their attention cannot fail to see the skill shown in its balance and in the management of projecting members and the knowledge of anatomy. The central figure is modelled with the most detail. Its action calls into play some of the most powerful muscles of the torso, and brings out the typical contours of the male for emphatic contrast with those of the female figure. In the latter, the emphasis is placed upon the softness and roundness of flesh, not only as characteristic of the sex, but of the period of adolescence as well, for the sculptor's design was to make the group an illustration of the three ages, by reproducing the soft contours of youth, the muscular development of maturity, and the more angular forms of old age. To group the three figures together, he makes use of the incident dedicated by tradition to the display of the nude, and to the contrast of the male and female figures. Most characteristic of the period is the treatment of the figures as three types of body, not three characters; so that, although his figures live, they seem to be animated by instinct, rather than by the passionate intelligence belonging only to man. It has been said of the

creations of Greek sculpture, that they do not "act," they "are." How far, then, from the Greek are such figures as these which do not exist as characters but as poses!

Once the group was set up in the Loggia, it was given the specific title, *The Rape of the Sabines*, after much popular discussion. The name matters little to us. The savage passion which we associate with the legendary episode has no illustration in the balanced figures of the group; but in the relief of the pedestal, which was made after the naming of the group, and which is Giovanni's best work in relief, there is a successful attempt to convey the wildness and barbarity of the struggle. And the group itself takes on, when seen across the piazza, an animation of meaning lost on nearer approach, as one sees in the shadow of the Loggia the uplifted white arms of the struggling woman and the straining shoulders of her captor.

Although Giovanni's *Mercury* and his *Rape of the Sabines* demonstrate his ability to handle both bronze and marble in the single figure and in the group, and place him in the first rank of the sculptors of the sixteenth century, he shows himself to be inferior to the masters of the fifteenth in the treatment of bas-relief, whether we judge him from his best work, the relief of the *Rape of the Sabines*, or from his least

successful, the pedestal of the equestrian statue of Cosmo de' Medici. The bronze doors of the cathedral at Pisa, which have been until recently ascribed to him, in design at least and partially in execution, are shown by recent research to be in all probability the work of another hand. So well, however, do they illustrate Giovanni's shortcomings in the treatment of relief, in illustrating the inferiority of the manner of his century to the manner of the fifteenth in that branch of sculpture, that they may with propriety be considered here.

Whoever the sculptor was, he had not the faculty of using his plans with that lucidity and effectiveness which was attained with so little apparent effort by even the minor sculptors of the previous century, and, needless to say, is far from possessing Ghiberti's power to handle the laws of perspective as magic formulæ of enchantment. One may stand before those dusty doors in Florence, while every sense registers personal discomfort, and gradually becoming oblivious to the odors, the dust, and the noise of a city square, swarming with the deformities of actuality, be rapt away by Ghiberti's harmonies, as truly as a Keats by the song of a nightingale, to worlds where discord has no part. At Pisa one is scarcely so fortunate, although here, as is rarely the case, the surroundings of the cathedral attune one to sensitiveness, for the

three stately buildings stand in a field of green and look over the city wall toward encompassing purple hills. The transition to ideal scenes would be easy, and one's fancy needs but a hint to be off. But the Pisan gates are ineffectual; they preach no new gospel of beauty, cast no spell over eye and imagination. They have their value in the general effect of the façade as a space of rich green in a color effect of yellow and red and green marble and brilliant mosaic. The weathering, however, which has given them their effective patina, has done its part in obliterating relief which could never have been very clear. The action of time has but increased a fundamental confusion of planes and an indistinctness of silhouette, which makes the effort to disentangle the design fatiguing and irritating to a degree little conducive to æsthetic enjoyment.

I have chosen for illustration one the clearest panels, the Visit of the Three Kings. Compared in composition, in types, in technique, with any of Ghiberti's panels, it has not a large excuse for being. The figure that strikes the eye first is that of a naked slave, not of the Madonna nor of one of the Three Kings. The bounding lines of the figures of the groups are so confused, and their planes are so wavy, that the eye finds it difficult to place any separate figure. The ugly crowns arranged to mark successive planes are hardly

PANEL OF BRONZE GATES

VISIT OF THE MAGI

Duomo, Pisa

(Period of Late Renaissance)

successful in creating the illusion of distance, and the perspective view of that stock feature of the paintings of the incident, the retinue of the Kings, is a complete failure. Its first spirited figures, however, the horse and its advancing sheik, are interesting, and, with the nude in the foreground, are most detachable and come the nearest to possessing that quality of attraction for the inquiring fingers which, felt so strongly in Ghiberti's panels, is properly the appeal of goldsmith work. The clean firmness of outline, the sign manual of that training in the goldsmith's shop which so influenced the technique of the early bronze workers, is wanting to the figures, and is an even greater loss to the over-heavy border. So overcrowded and so little conventionalized are the fruits and flowers composing it that the design is smothered in the foliage, as are some charming small lizards and birds which surely deserved a better fate.

Even although these tiny creatures of the gates must, with the reliefs, resign all claim to being the creation of Giovanni da Bologna, they are not unworthy to be members of that fantastic company of decorative "grotesques," of whimsical monsters and devils which were made by his hand, which are to be met with often in Italy and here and there in the world's museums, and which make us wonder at the productiveness of his fancy, and serve to enrich and en-

liven our whole concept of the decorative side of Renaissance sculpture. And such objects as the appealing devil of the Via Vecchietta, and the sprightly dolphins of the fountain at Bologna so hardly curbed by the attendant cupids, not only delight us by their inherent blitheness, but come also to be of value to us as signs and symbols of times, when, as we fondly imagine, objects of daily sight and use were made beautiful, and the great artists were also craftsmen.

CHAPTER IV
BENVENUTO CELLINI

CHAPTER IV

BENVENUTO CELLINI

(1500-1571)

THE existence of the choicer things of daily use and ornament, such as the work of the smith in precious metals, the jewellery, the intaglios, the embroideries, the objects of ivory and enamel, in short all that varied product of the craftsman which makes the natural atmosphere for the larger work of the artist is, in any state of civilization, of all too short a lease. The intrinsic value of their material, their fragility, and their portability expose them to vicissitudes that few survive, and any epoch must construct its images of the handiwork of former days from the flotsam and jetsam of collections, and from the descriptions to be found here and there in literature. Although the latter aid to the imagination is not to be compared with the former, yet, taken in connection with some familiarity with the actual objects left us, it serves the purpose of rebuilding them and their like into their places in the structure of former daily life.

No writings of a period add so many concepts of its lost beauties, and better show them in their relations to people's feelings about them, than do the treaties and autobiography of Benvenuto Cellini,—type of the Renaissance braggadocio, man of lusts and lies and poetic fancies, true artist always, and the best goldsmith of his times.

Now, although in his narratives of his relations with popes, and princes, and kings, Cellini has occasion to speak of the antiques that they treasure, and although he often describes the productions of his contemporaries if only to dispraise them, his chief concern is with the history, and description, and eulogy of his own works, all of which matter he sets forth in so lively and persuasive a style that the jewelled cups, and the salt-cellars, and the buttons, and the helmets of which he discourses and which have, for the most part, disappeared from the world of visible objects even as have their owners, are almost as clear to our mental vision as the images of many objects upon which our eyes have looked their fill. And as for the comparatively few pieces which are preserved in museums, they acquire from Cellini's words a kind of glamour which causes us to give them an unusual degree of attention and appreciation. Few can be seen to-day of that host of lovely things that Cellini made during his years of industry. A few cups, some medallions,

the cover of a Book of Hours, a salt-cellar, — these are the best authenticated of many like objects attributed to him, and are all that remain to us of the work of Cellini as goldsmith.

Of Cellini, sculptor, we may see the statue that earned him the title standing in the Loggia dei Lanzi in Florence, where it has stood since Cellini himself set it there, swelling with pride as he exhibited it to the city, and thinking the plaudits that met his ears ample recompense at last for his sorely hindered efforts. In looking at the Perseus, nobody who remembers Cellini's vivid account of his labors, and of the excitement of its casting, can wholly separate, in his impression, what his eyes really bring him from what he prepares himself to see. Perhaps some faint thrill remains, from the memory of Cellini's narrative of its casting, of that scene in the workshop when the metal had ceased to flow, and Cellini, risen from a bed of fever, rushes in to save his precious statue, hurls blows and curses and orders at his frightened men, and finally, to fill the mould, casts into the caldron all his three hundred pieces of household pewter. Or perhaps there seems to still linger for sensitive ears a thin reverberation of the praises which the piazza echoed hundreds of years ago. However, counting out such factors of impression, the statue easily appeals to one as being far ahead of the other sculpture

of this time, except of course Michelangelo's, in being a sincere expression of personality. That it attempts to conform to no classic model is evident enough from the realistic detail of the result of decapitation. The classic principle of the balance of members is followed. As to the rather unsatisfactory proportions of the body, the long torso, and the thick legs, it is probable that they are not the result of a rejection of the classic, but followed the enlarging of the small model. Comparison of the statue with the first wax model of the Bargello, which is so much happier in its proportions, would seem to prove this supposition. This small figure, made on the scale which best suited Cellini's hand, has a sort of lightness of figure, and a debonair grace which is most attractive. The same qualities are so diluted in the bronze statue as to be hardly recognizable, and yet they are, I think, at the bottom of the pleasant impression.

Another indication that the maker of the Perseus was goldsmith rather than sculptor is the careful and complex treatment of certain details, the ordered intricacy of the snakes of the Medusa's head, for instance, and the elaborate helmet, a consummation in metal of such a design as, when one looks at the drawings in the Uffizi left by Cellini of fantastic helmets crowded with strange animals and figures, seems only possible on paper. The fancy and hand of the goldsmith is above

CELLINI

PERSEUS

Loggia de' Lanzi, Florence

DONATELLO
BRONZE DAVID
Bargello,

all obvious in the ornate pedestal. The latter is too narrow for its statue, and is weakened by over-ornamentation. The four statuettes of its niches are classic in name, and are quite in the conventional manner of the day. The various details, masks, rams' heads, etc., are the product of a skilled and original hand, but they present no unity of design.

However much the eye may linger over the rich details, the mind does not lose sight of the fact that they are but parts of the whole, and an element which perhaps increases our enjoyment by giving us the feeling that the figure was conceived in the truly romantic and not in the pseudo-classic temper. That is the reason that, as a visualization of a well-known hero, it is satisfactory. Yet if one has no wish to replace his own image of Perseus and of the Gorgon's head by Cellini's, he can gain some pleasure from a representation of youth and strength seen at the moment of the accomplishment of an action.

CHAPTER V

MICHELANGELO

CHAPTER V

MICHELANGELO

(1475-1564)

THE artistic power of genius itself is not born Minerva-like. Mature as it shows itself to be even in its earliest works in its independence and assurance, it has yet had its period, however brief, of dependence upon and assimilation of the knowledge and the spirit of its environment. From the past it inherits, as does the smaller talent, but it is quick to make claim to its own, and to reinvest. It reveals itself as genius because it can select, and assimilate, and transmute, and can then put forth results, not processes.

No artist has seemed more self-directed and self-nourished than Michelangelo. Yet he is moved by the tendencies of his day, shares in the popular enthusiasm for science and ~~for the antique~~, and is as eager to dissect dead bodies in the cell at San Spirito as to study from Lorenzo's antiques in the garden of San Marco. And, in fact, in all of his early works, in the sculpture of what may be called his first manner, that produced

before he is summoned to paint the Sistine Chapel, he shows that he has reached, by the same processes, the same state in the representation of form that is attained by the best work of the High Renaissance, that is, he has learned to construct his figures according to the laws of nature and the scale of classic proportions. He likes to display the effects of physical exertion in figures of full muscular development and over life size.

But Michelangelo did not remain at this stage of development. He outgrew his satisfaction in such an ideal of form, and gradually evolved one which better expressed him. The first man since the Greeks to comprehend the scope and expressive capabilities of the nude in art, to see that it may express us to ourselves with a directness only paralleled by the power of music, he was bound, as he mastered the technique of his art and as his nature developed, to put into the language of the nude those unrestrainable thoughts and emotions which, while truly his, yet had been and were to be, in the evolution of man's spirit, typical of a view of life which had been practically unfelt by the classic peoples, and which certainly had not been nor could be expressed in the classic ideal of form. Now, if these unclassic ideas and emotions were to find expression through the language of the nude, there was necessary an arrangement of proportions and parts which should

differ from the classic in order to express the not classic. It is in the sculpture of what may be called his second manner that Michelangelo arrives at a presentment of the nude figure which so differs from classic canons, in the treatment of relations and proportions, that it expresses thoughts and feelings never before expressed in form, and establishes in its turn, as had the Greek before it, conventions in the representation of form which were often misunderstood by later sculptors, and which became in their hands imperfect formulæ, misapprehended and misapplied.

FIRST PERIOD

The early work of Michelangelo in sculpture is that of a youthful personality directed more by its preferences than its passions, and, as is the case with all early work, however thorough the artist's assimilation and striking his individuality, it lets us into the secrets of his studies, rather than into those of his experiences. There is his earliest work, the relief of the Centaurs, to prove his use of antique models, and there is the Cupid, of which the story goes that after being buried in the ground it was sold to a connoisseur as a genuine antique, to prove how quickly the lesson of the classic manner was learned. And there is the statue of a drunken youth, miscalled Bacchus, to show observation of nature and close study of the living model. And

there is the series of gods, of which the Apollo and the Cupid are examples, to indicate, that, although felt with an ardor and carried out with a vigor unknown to the lesser sculptors, his ideal of form was practically the same as theirs, that is, he wished to represent the nude figure on as large a scale as possible, he felt the beauty of ample, symmetrical development, and the stimulus of vigorous action. Although any and every work of this period reveals originality and power, it is in the last works, the *Pietà* and the *David*, that there is evident the most complete transmutation of knowledge into creative power.

The Pietà

The treatment in art of any religious subject such as this traditional one of the *Pietà* tends to become symbolical rather than to remain truly illustrative. That is, the *Pietà* is the illustration of an incident, of the pity of Mary at the moment when she takes upon her knees the dead body of her son; but it tends to become more than the portrayal of physical and mental suffering, to become a symbol of a sacrifice made for the sin of humanity; and therefore, as a so pregnant religious symbol, it arouses emotions which naturally flood back upon, and perhaps somewhat inhibit, the purely æsthetic consideration of it as a presentment of form. This, I think, accounts for the fact that

MICHELANGELO

PIETÀ

St. Peter's, Rome

many writers in treating of Michelangelo's *Pietà* have spoken as if it conveyed to the mind directly and forcibly some very definite thoughts as form, which seem rather to belong to it as symbol. They find that the figure of the Madonna expresses profound grief, sanctity, submission, and clairvoyant resignation, and they see in the figure of Christ a sacrificed divinity. Now, do not these ideas belong to the associative appeal of the group? Is not the one idea actually apprehended through the senses this, namely, the pathetic idea of the support by a living body of a helpless dead body? We see that the relation between them is of the closest, and the feeling of pathos is aroused. That we know from the subject that they are mother and son, that we know that they are Mary and Christ, makes concrete that pathos, and deepens and enriches it by many associations which carry us in emotion beyond the actual feeling that the figures of themselves have the power of stirring.

The figure of Christ is under the size of life but well developed, and is carefully modelled and finished. The relaxation is so skilfully conveyed that it typifies to us that very moment of the cessation of life which is not collapse, nor *rigor mortis*, but the moment when the body becomes dead weight, yet is still warm and supple. The figure of Mary is proportionately larger, and supplies the living support of arm and lap.

Identification in imagined sensation with either figure, to feel the absence of life or to feel the resting of a dead weight upon one for support, is productive of deep emotion. In its power to arouse that emotion is the great æsthetic merit of the group. Details add little to the language of the figures. The heads are more carefully finished than is usual with Michelangelo, but the faces, in type and expression, are not impressive. The composition is most skilful, for the two figures are truly united into a group by mass and line, so that the whole has the monumental quality of a unit, while each figure makes its subordinate appeal.

Whether we choose, in our enjoyment of the Pietà, to emphasize the emotions which as symbol it arouses, or which as illustration it defines, they are built upon a genuine æsthetic appeal; a communication by form of the pathetic idea of the relation of the living to the dead, which must include, with all sorts and conditions of men, many emotions that are not always crystallized into religious incident or personal experience.

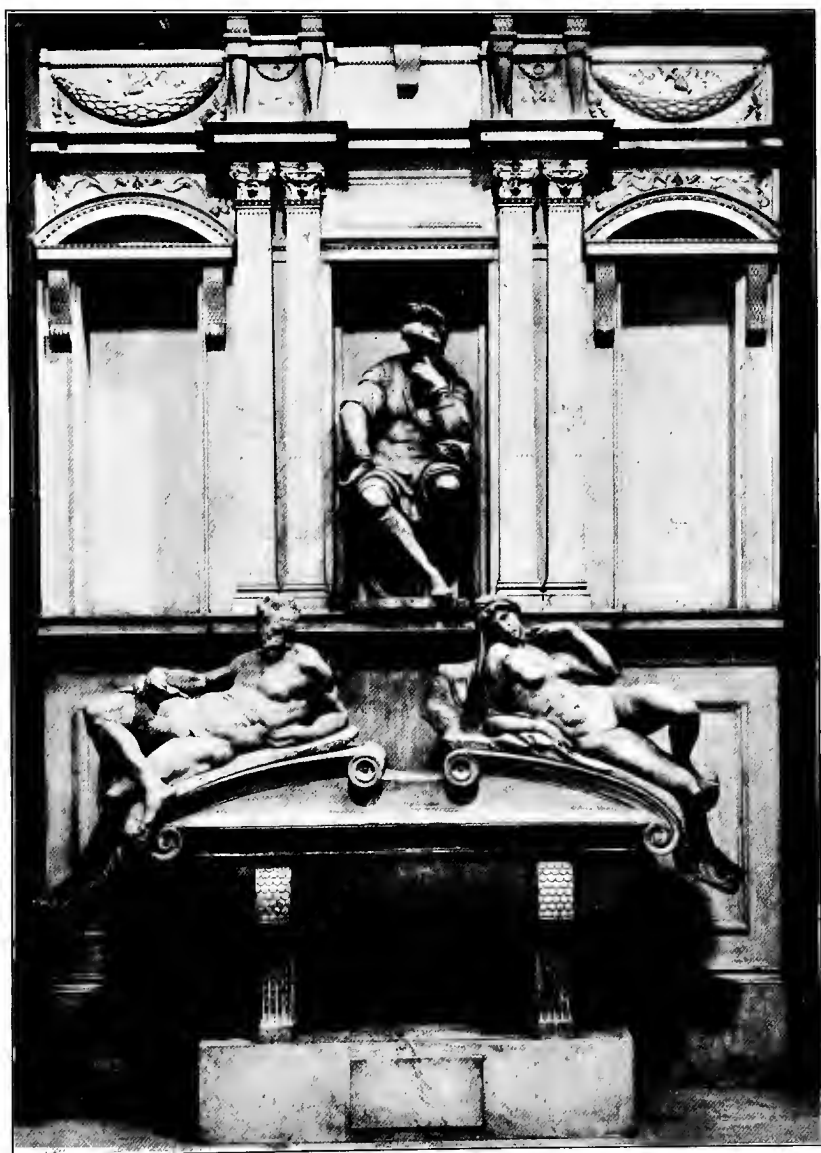

The David

It is not as a religious symbol, nor for its æsthetic value, but simply on its merits as an illustration of character that the David appeals to nine-tenths of the visitors to the Accademia. If they like the colossal statue, they like it because of its realism.

"David probably was," they say, "just such a half-grown boy as Michelangelo has represented him to be: huge in build and capable of putting forth phenomenal strength in a sudden effort, under the impulse of an excited will." If they dislike it, they dislike it because of its lack of idealism. "How is it possible," they say, "to conceive of this awkward boy-giant as playing the part of a hero in the story of colossal Might overcome by puny Right? This huge creature might easily slay the lion, and the bear, and the Philistine, and need no miraculous aid from heaven. The engaging weakness and grace and dreamy face of the David of Donatello, and of the David of Verrocchio, are truer because more poetic illustrations of the hero of the legend."

Both views are based upon the strong realistic impression which is the striking artistic characteristic of the figure. For it is simply the figure of an undeveloped boy, so cleverly enlarged that not a characteristic of the type is lost, although the species has become the giant. In every aspect of the technique of statue-making, the science shown is remarkable. When one realizes that a youth of twenty-four, with the aid of a small working model of wax, made this colossus from a piece of marble already considered spoiled by another sculptor, the correctness of eye implied, and also the exactitude and intricacy of cal-

culcation shown in getting out the figure, posed appropriately on the whole, proves it to be the work of one who is already a master of his art. So well planned is the distribution of weight that there is necessary for external support only that fragment of the block upon which the right leg rests. The bodily forms are defined with much accuracy, and despite the general angularity and disjointedness natural to the undeveloped type, the flow of line is continuous and full of vigor. The modelling shows the sensitive chisel of a knowing master. Notice the muscles of the upraised forearm, the bones of the thorax, and in the knee the difference between bone and muscle. The turn of the head makes such a chance as Michelangelo well liked for the modelling of straining neck muscles. The knitted brows and the heavily massed hair recall the St. George of Donatello, but the expression of the face is not, as in the former, an almost wistful look of boyish earnestness, but the fierce glare of an angry young giant. Could we see the powerful young figure in the place chosen for it by the Florentines, guarding the entrance of the Palazzo Vecchio, we might be enabled to enjoy without fatigue, as is not possible in its present situation, the realistic force of the impression. The niche which it now occupies was planned for it, and is as sufficiently large as any indoor space could be. To

MICHELANGELO
TOMB OF LORENZO, DUCA DI URBINO
"IL PENSIEROSO," DAWN, TWILIGHT
Sacristy S. Lorenzo, Florence

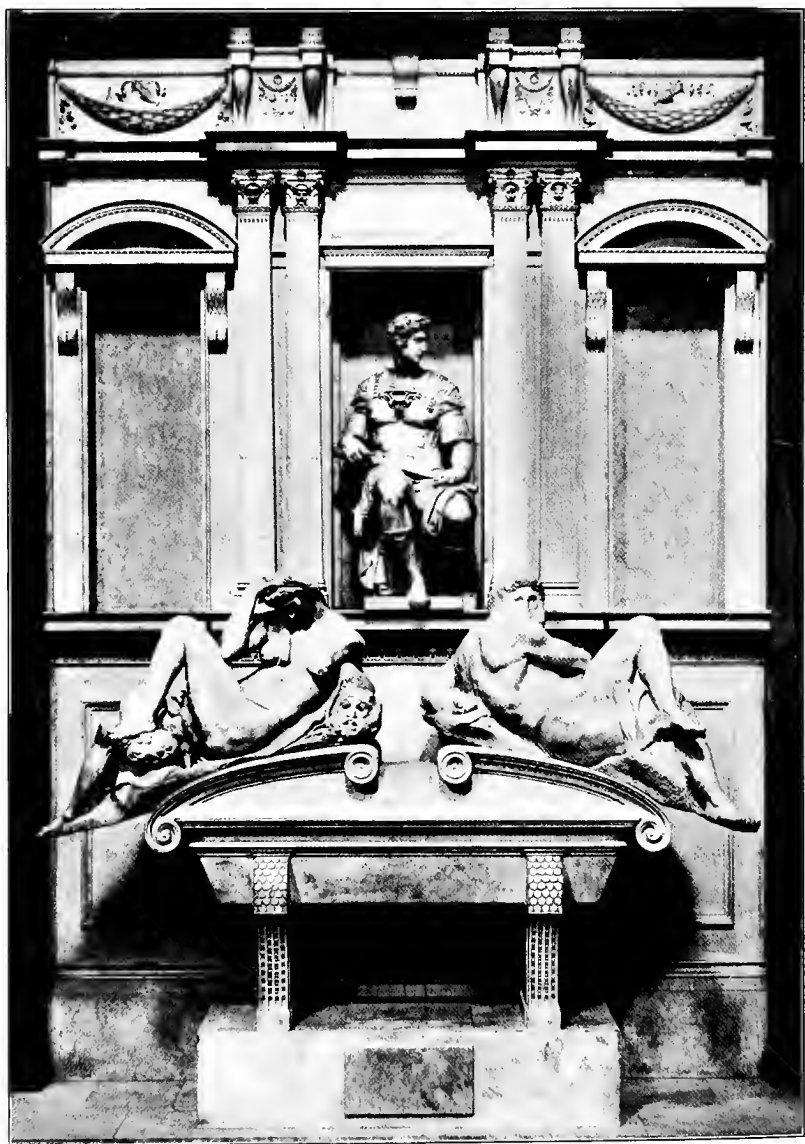

be sure, the reasons for surrounding it with Fra Angelico's most miniature-like work are obscure. Indeed, the dominating presence of the David sometimes follows one into *Il Paradiso* and prevents heart-whole participation in the rapture of tiny circling saints. But the real reason, I think, for the lapses in enjoyment which are sure to occur during one's contemplation of the David, is found in the fact that the young sculptor has chosen, as an older sculptor would not have chosen, to represent the most awkward state in the development of the human body, and every defect of development is emphasized by colossal size. So that, although the thing is so well done that it communicates the sensations of physical energy directly and with a rush, it is not, after all, a form that can steadily invigorate, for it is the arrest in stone of a transition in growth.

SECOND PERIOD

Between the year 1504, whose month of May saw the great David dragged through the streets to its place before the Signoria, and the year 1520, when Michelangelo began his plans for the tombs of the Medici in San Lorenzo, which are the exponents of his second manner in sculpture, there had elapsed sixteen years. And in these sixteen years, at the best working period of a man's life, this man had suffered

disappointment and disillusion; and, most insupportable of all, his artistic energy had been hindered and forced for many long years to find its outlet in painting. When, therefore, he comes again to work uninterruptedly at sculpture, he brings to it a radically different set of feelings which demand relief, and a hand and eye which painting has taught new effects. Lost as they soon are in other impressions, such effects are perhaps what one notes at first glance upon entering the shadowy chapel of San Lorenzo, which contains the tombs of Giuliano and Lorenzo de' Medici. As in the Sistine one may mark the sculptor expressing himself in terms of painting, so here in slighter degree one may see the use of methods which painting practises to obtain its light and shade values. In some places the stone is highly polished for the emphasis of high lights, in others left rough for shadow quality, and the composition of the figures, determined of course by other motives than the desire to follow picturesque methods, is yet such that it reënforces picturesque effects.

The two seated statues framed in their recesses might be analyzed from any selected point of view into light and shade compositions, and it is evident that they were carefully planned with reference to the amount and direction of the light from the lantern above. They are in no sense portraits of the men

GIULIANO, NIGHT, DAY
Sacristy S. Lorenzo, Florence

whose names they bear, and whose bones rest in the sarcophagi at their feet. A fondness for contrast in ideas has decided that they typify the two extreme types of mankind,—the military hero and the thinker. Perhaps they do. It is nevertheless significant that, while the one goes by the name "*Il Penseroso*," The Thoughtful One, The Thinker, a proof that we welcome it as a worthy image of one of a common stock of definite conceptions, the other stands for no clear-cut conception which should force upon it an indisputable epithet.

The *Giuliano* is a well-composed and strongly modelled figure, which repays study by giving the eye an education in surface values. There is no satisfactory meaning to be attached to his action. For the turn of the head shows absorption in some spectacle, and the position of the legs implies that he is about to rise and act; but, in contradiction, his thin, nervous hands are relaxed, one of them touches, without grasping, the baton of office, while the other rests supinely upon his knee. It is merely the turn of the head and the outward direction of the gaze which we interpret as an interest in the objective which makes the contrast of this figure of *Giuliano* with the figure called "*Il Penseroso*," whose absorption in the subjective is unmistakable.

Indeed, there is no chance of disagreeing about the

meaning of *The Thinker*. It is eloquently set forth, writ large in the relation of arm and head, the traditional attitude assigned to meditation, and more subtly to be read in the pose of the body, which rests its full weight with the least possible exertion of muscular force, and as if it were insensible to messages from the outer world. The impression given, that the attention has withdrawn from outer in order to concentrate itself upon inner phenomena, is enhanced by the treatment of the face,—that register of conscious sensation. For it is left partially unfinished, the heavy shadow of the helmet falls over the eyes, sending them back into their sockets, and, since the finger on the lip hides the expression of the mouth, the facial expression may be harmoniously supplied by the imagination.

Although, as I have said, the seated figures hint in their composition at a pictorial training, it is not in them but in the four nude figures below that Michelangelo continues a treatment of form which, begun in the ceiling of the Sistine and ending there also in the vehemence and mannerism of the *Last Judgment*, finds here the apex of its effect. What that effect is may perhaps be come at by analyzing the material which our eyes can get for us.

The mind seizes upon the first data furnished by the eye, in order to recognize the object to which its

attention is directed, in order to place it, if possible, in some known category, to call it by its name. Now in the endeavor to recognize these figures, we review the categories in which we are accustomed to place the figures represented in art, without finding one to which their characteristics will admit them. That they are neither historic individuals nor calendared saints, is obvious at the first glance. Nor in body or soul are they the gods or the heroes as we know them from classic art and mythology. Powerful and strange as they are, they are not types of the primeval human, for the organized structure and the small and refined extremities suggest no struggle for existence with the brute forces of nature. It is plain that there is no place for them in our traditional nomenclature. Yet after all they are made in our image, and our nature gives us the key which opens to our comprehension theirs. Entering in by imagination, we are changed to their likeness and take on an ultra-human nature, like to ours in kind, but beyond it in intensity and scope.

After placing an object in or out of a category, and settling in some fashion upon what it is, the next step is to say to oneself how it is, and what it is doing, to define its action and state by means of its attitude and structure. The attitude of each of these figures is one of contortion. The limbs are drawn up, the torso

is twisted, the outlines from every side show the contraction and swelling of the muscles that move the body. Such muscular contortion has several natural explanations to eyes which seek cause for effect. It may be explained as the result of violent action against some outside force, as it is in the struggle of Laocoön and his sons with the serpents. Or it may be the result of physical suffering; the tortured martyrs might thus have writhed. Muscular contortion must, in the nature of things, spell suffering and struggle to our minds. Now, if there is no cause visible to explain that struggle and suffering as a physical result, no serpents, no martyr's wheel, we leap at once to the conviction that it is the struggle and suffering of the spirit which distorts the body. Thus, for the first time in sculpture, is bodily attitude made expressive of spiritual struggle.

Not one of the figures counterfeits a pose with which we are familiar in sculpture or in real life, or even regard as possible except as one of the kaleidoscope postures of a gymnast. Yet, because we recognize that the sculptor has deviated from the normal in constructing these figures, we accept as possible to them, ultra-human as they are, attitudes which in realistic figures would be intolerable. In the first place, the proportion of parts makes for itself a new formula. In comparison with classic canons, the heads are too

small, the forearms and the lower legs are too slight for the broad shoulders and huge torso. What differs most strikingly from the structure of classic figures as from that of the normal human is the strange emphasis laid upon certain portions. The muscles stand out upon the shoulders, the breast, and the thighs, in fact, those muscles which are used in feats of strength are much exaggerated. Such abnormal development would be explained in a Hercules, or in a fighting giant, by the character and the action. Here it makes an impression of power unapplied, so that we feel that thwarted strength is reacting upon itself. Stranger than this emphasis of the motor muscles is that of the muscles of the lower torso, which are mapped out as if by an anatomist who wishes to demonstrate their position and relations. They are to be discerned as plainly as if the levelling layer of fat beneath the skin had been withdrawn. To comprehend Michelangelo's exaggeration, one has but to compare his Day with the Venus of Melos, or, more profitably, his Twilight with the Theseus of the Parthenon, since the upper part of the torso has in both figures much the same attitude. The lower part of the Theseus is in a normal reclining posture, while that of the Twilight is twisted to bring into play the muscles of abdomen and stomach. It should be remembered, too, that the Theseus was long exposed to the effects of weather; yet it must

always have given the idea of a bony structure, fastened together by muscles, and holding within it the vital organs. The Twilight appears in comparison to be an elastic muscular structure in which are embedded the bones, and which holds loosely the heavy vital organs. The difference in imagined sensations induced by both is naturally great. In the case of Michelangelo's figure, the calling of our attention to organs which nature has not emphasized externally, and of whose action we are scarcely conscious except under conditions of extreme pleasure or pain, heightens our impression of the intensity of life in these figures, and makes their vitality commensurate, in our fancy, with their muscular force.

To sum up, our consideration of the attitudes and structure of the four figures has brought out the facts that the contortion of the bodies, the novel proportions of their members, and the strange emphasis laid upon certain parts give us imagined sensations which we translate into the idea of the spiritual struggle and suffering of beings whose vitality is far beyond that of the ordinary human; so far beyond, that, to some imaginations, in their persons seem to be typified the struggle and suffering of the race.

The general impression gained from all the figures is more or less particularized by the peculiar characteristics of each one, and is perhaps made more con-

crete by the names. Of all the figures the Twilight gives an outline which most nearly approaches the normal. The relaxation of the right shoulder and arm, and the droop of the head toward the breast, may signify that at the coming on of night the exhausted being is sinking to a repose which is unsweetened by physical weariness.

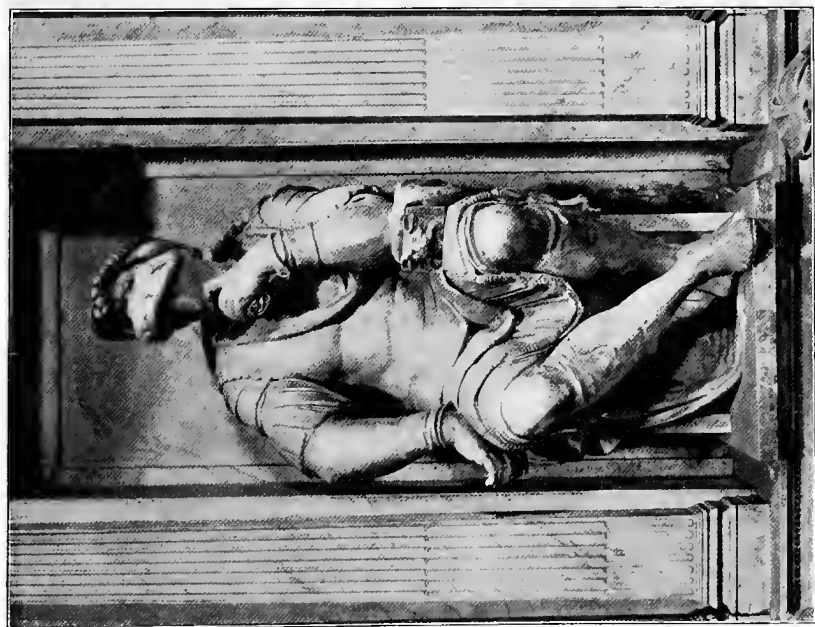

The Dawn is more definite in idea, for we recognize in its action the natural attitude of one who painfully lifts herself from an unrefreshing sleep. The deep-set eyes are masked with heavy lids, and the wrinkled brow and the half-open mouth give the face an expresssion of hopelessness which accords with the heavy awakening of the body.

The Day and Night are even more strange in attitude than the figures of Lorenzo's tomb, and in outline are so unusual to eyes accustomed to read only the meanings of the ordinary human outlines that they seem to convey their meaning in passionate exclamations.

In looking at the Day one sees from no point of view an outline with which the eye is familiar, for the figure is so twisted as to show both back and front at the same time, and the muscles are so bunched that the outlines seem made of a series of short curves. Has this being been suddenly awakened from sleep by an enemy that he should so fiercely draw himself together for defensive action as

a wild beast preparing for a spring? The figure is unfinished. It is highly polished in parts; but the head is only blocked out—could not be cut down, they say, without breaking the marble. The clinging to it and to the arm of the rough material, as well as the shallowness of the undercutting along the back, give us leave to fancy that thus, in the figure's seeming effort to detach itself from the block, is typified the struggle of the day to separate itself from the chaos of dark night.

It is passing strange that the companion figure of the Night should be able to impose upon us the idea that it is filled with slumber; for did we regard it as the presentment of a normal human figure, we should realize the great discomfort of its attitude and the impossibility of maintaining such a pose, asleep or awake. But so firmly does the mind hold to its conviction that sleep enwraps the figure, that the sensations induced by its attitude are not recognized as physical, but pass at once into their mental equivalents, and seem the sufferings of a soul which finds in the heavy sleep of exhaustion only a half oblivion of despair. Its consciousness takes no note of the external world, but is nevertheless still cognizant of its own pain. The figure might well be that *Melancholia* seen by Dürer and by Thomson, but here more "subtly of herself contemplative." The outlines are more interlaced than

MICHELANGELO
"IL PENSEROSO," NIGHT

in the Dawn, but the modelling of both head and torso suggests a greater nobility of type. In modelling and in outline the bent leg is especially beautiful.

Once led into the use of the word "beautiful" in connection with these figures, the mind begins to inquire what satisfaction there is in Michelangelo for the sense of beauty. It has been tacitly assumed from the beginning, that the "beautiful" in an object of art is that quality which, interacting with the senses, gives an enjoyment which is originated and determined, if not limited, by such interaction; and also that, since human senses are not all of the same keenness, and because the association of ideas varies with the individual, the assertion that this or that in a work of art is "beautiful," is an assertion of individual enjoyment. That there is, however, a "standard of the beautiful" in sculpture is evidenced by the fact that in the particular case of Michelangelo's sculpture the critics show always a tendency to draw distinctions, and to say that his works are "expressive," and "sublime rather than beautiful." Now such a tendency indicates this at least, namely, that the kind of enjoyment gained from Michelangelo is not that given by sculpture ordinarily. Whether one objectifies his enjoyment as the quality of beauty, or of sublimity, or of expressiveness in the object, it is the same æsthetic appeal to which each responds according to his

capacity, and which is itself dependent here upon two things, — the observer's ability to read the language of the nude, and, once read, his sympathy with its meaning.

It is true that the observer who stands before the nudes of Michelangelo neither as an artist nor as an anatomist is in a position analogous to that of one who listens to a play in a foreign language. Although he may miss the niceties of meaning in the lines, he is perhaps for that very reason more alive and susceptible to the emotions aroused by the acting. Without fully understanding the science and the motives of Michelangelo's nudes, the ordinary observer is receptive of their communication of physical vitality, and feels the rush into his consciousness of a power more than human, which acquires its great intensity from being banked up and afforded no outlet in physical exertion; and, with the imagined sensations of thwarted physical force so conveyed, there is the simultaneous arousal of the ideas and feeling of spiritual struggle.

Since the individual experience is the measure and interpretation of that feeling of spiritual struggle, and since spiritual experience, differing more than sense experience, has not a fixed vocabulary for its expression, each individual makes the common impression wordable to himself along a personal line. One may put it into terms of religion or ethics, another may see in

it the apotheosis of his own puny struggle with fate. To one who is familiar with Michelangelo's life and the history of Florence, it may well seem to symbolize both his bitter conflict and the sufferings of an enslaved city. The temperament feels what it brings the power to feel. Whatever the environment has been, if one is akin to Michelangelo in temperament, he will feel before these figures the exaltation and incorporation of forces whose workings he has felt or is destined to feel, and he therefore obtains a great æsthetic pleasure. As it happens, the generations since Michelangelo have shared in that temperament so generally that he has expressed them to themselves, and in so doing afforded to the modern consciousness the relief of defining itself in art.

Yet as any mode of artistic expression, however deep and wide it be, will always be inadequate to all sides of human experience, there will always be a minority who feel its scope, but whom it does not express. Therefore there are temperaments who feel Michelangelo's powerful communication of vitality, but who cannot so enjoyably translate it into intimate emotion. They feel the lack of that "purgation" of emotion, following the display of strong feeling, which to them can alone make spiritually invigorating the excitement of those feelings by art. His types have not to them that nobility that would make for such

"purgation." There is no stronger influx of vitality to be gained from the Dawn than from the Venus of Melos, and from the Fates of the Parthenon draped though they be, and there is in the former a suggestion of animalism in the abnormal isolation and development of the muscles of the breast and abdomen which lessens the dignity of its meaning.

To conclude, then, the imagined sensations induced by the contemplation of Michelangelo's figures are probably the same with all sensitive people, but their translation into individual emotions and ideas is the cause of differing degrees of æsthetic pleasure.

What Michelangelo's own attitude toward his creations was, we can only surmise. He probably never intended them as a conscious revelation of his soul. As an artist, he liked to make figures which in outline and modelling represented physical force, and called into play his scientific and technical powers. And yet, because he made his art, probably unconsciously, the true outlet for his soul, using marble and chisel as a musician uses his instrument, as wordless song, his art is a personal confession, and he is, in his self-revelation, the first of the moderns.

CHAPTER VI
SCULPTURE OUTSIDE OF TUSCANY

CHAPTER VI

SCULPTURE OUTSIDE OF TUSCANY

HAD the aim been, in marshalling between the covers of a small book some part of Renaissance sculpture, to attract the attention of the reader, not to its æsthetic values, but to the historical and literary values which give it intellectual interest, not only would the manner of presentation have been different, but the matter presented would not have been the same. For the objects selected for consideration must have been manœuvred to show their relations to their makers and to contemporary effort, as well as to our æsthetic sense; and not only would they have gathered in that process an accretion of biographical anecdote and historical fact to swell the material presented, but, to satisfy the demands of the inventorial and the philosophical and the historical interest, it would have been necessary to include in the text some mention of the many works of the many men who handled the chisel and the clay. And had, then, the intention been to show forth the interest of this period of sculpture, rather than to make

evident its æsthetic appeal, it would not have been allowable to limit the field gone over to the notice of Florentine masterpieces, thus making the title Italian Sculpture practically synonymous with Florentine Sculpture.

Yet, since the aim has been to separate and emphasize that side of one of the three great historical periods of sculpture which affects us through sensation, to attend as it were to the phosphorescent gleam rather than to speculate over the conditions causing it, it is justifiable to use the most direct means to that end, and therefore, for the purposes of realizing its æsthetic essence, to consider that Florentine sculpture is synonymous with Italian sculpture, and that, to distinguish the æsthetic appeal of the sculpture in Florence is to have a general concept of the historical period as compared with other periods. For, in the first place, Florence contains the best sculpture of the time under discussion, and, in the second place, it contains the most of the best sculpture, so that there is both quality and an accumulation of quality to make strength of impression. In the third place, in no other city or town of Italy is there an atmosphere so able to give this impression a clear-cut form, and thus add definiteness to depth of comprehension; for Florence has its national museum of sculpture, whence art of other appeal is really excluded, and its churches and squares are still

rich in works remaining *in situ*, breathing freely, unsmothered by the antique, or the baroque, or the modern; and, moreover, in Florence even the rival art of painting, since it treats as its theme the problems of form, does not antagonize nor absorb the appeal of sculpture, but even in a way reënforces it. There is, to be sure, some store of Renaissance sculpture in Rome and in Naples, but it is hidden away in dark churches, and is not able to prevail in an atmosphere heavy with the baroque and the antique. In Milan its infrequent examples are fast being overshadowed by modern building. In Venice it surrenders its unique appeal as sculpture to join with painting and mosaic in the great decorative appeal of Venetian architecture.

Moreover, were one able to get clear-cut impressions of the Renaissance sculpture found outside of Florence, and were to add them to his general concept gained from Florentine examples, he would not affect his æsthetic sum-total, and this for two reasons. First, because, for the most part, the sculpture of other places will be found to be, when it gives us definite pleasure, the work of a Florentine or of the Florentine school. This is very evidently true of Tuscany, and it is also true for North and South Italy, for their cities imported better sculpture from Florence than they could make themselves. Secondly, when the sculpture is actually the product of its own soil, although it has a

genuinely native appeal differing from the Florentine, yet such appeal is in strength and quality so insignificant that it cannot modify our general concept; and therefore to dwell upon it in individual examples would be to inflict upon Florentine sculpture a loss in proportionate value — would be, in short, to miss the wood for the trees, to lose the characteristic shape of the constellation one is seeking by looking through a telescope at some portion of it.

Had the range of treatment included a detailed criticism of decorative sculpture, the space apportioned to non-Florentine work would have been a large part of the whole. But, as supplementing only brief descriptions of such characteristic masterpieces of the masters as can make clear our kind of enjoyment in this period of sculpture as distinguished from other periods, it is possible to make only a few rough statements concerning the slightly differing species of Renaissance work to be found in Naples, and in Milan, and in Venice.

In Naples to-day the student of art will find that his senses are keyed to the appreciation of the antique by the splendid collections, and even by the reproductions of the shops, unworthy parodies as they are; and after he ferrets out in the crowded churches the slender store of Renaissance work, he is often unable to be more moved by it than by the votary fripperies

with which a superstitious population has almost covered it. The pre-Renaissance tombs best hold their own against the antique, and the realistic tableaux in painted terra-cotta are interesting and often momentarily impressive in their naturalism of attitude and expression. A typical development of Neapolitan sculpture there could not be, for the political agitation of Naples during the Renaissance period rendered the evolution of art impossible, and made necessary the importation of sculpture from Florence and from Lombardy.

Indeed, the true home of the terra-cottà figures of Naples is North Italy, and they illustrate, especially in Milan and Modena, one of the happiest phases of the art of Lombardy, which, on the whole less intellectual, less poetic, and less scientific than the sculpture of Florence, has much to attract in its grace, its sprightly realism, its portraits, and its richly decorative effects. Yet of the myriad statues of the Milan Cathedral, the output of its school of sculpture, not one has conspicuous distinction, and the majority are the work of men who did not rise above the level of stone-cutting. The Certosa of Pavia is indeed a rich treasury of North Italian sculpture, and contains also much good Florentine work. It is incrustated within and without with sculpture of various periods and of differing styles; but, of all the regional work, none,

save that of Amadeo, whose name only may here be mentioned, can in technique and refinement be classed with the sculpture of Florence.

Of all the non-Tuscan sculpture grafted with the Renaissance Florentine, that of Venice was most fruitful, and yet most faithful to its proper soil, for it maintained always a decorative character and attuned itself to the rich, free, sensuous strain of Venetian art. Even the works created in Venice by foreign sculptors partake of the Venetian spirit, and as seen now by the traveller appear to him to be congruous elements in architectural effects, whether he stands before the rather dry statues of Adam and Eve made by Rizzo, the first introduction of Renaissance sculpture into Venice, or notes, as he must, for they are everywhere, the ample, sensuous, pagan types of the Venetianized Sansovino.

What could result from the union of the spirit of Florentine sculpture with the Venetian spirit is supremely illustrated by the equestrian statue of Col- leoni, a production which is the masterpiece of Venice, and which has never been surpassed in the equestrian sculpture of any time or nation. It was begun by Verrocchio the Florentine and completed by Leopardi the Venetian, and the share which each had in the work is still one of the unsettled questions of art criticism. Yet, to whichever side the scale should

turn, it is evident enough that neither sculptor alone could have achieved so perfectly expressive a result. For it is the welding of the Florentine's science and distinction of style with the Venetian's keen sense for the external appearances of life which makes the whole amply expressive of a personality and an age. If we add to our enjoyment of this masterpiece the pleasure given, in its similar communication of vitality, by Donatello's Gattamelata, we shall find that the sum of æsthetic values realized from these two equestrian statues is so great that it makes, as it were, an individual line of color in that spectrum of æsthetic values which is characteristic of the Italian sculpture of the Renaissance.

A LIST OF THE TITLES AND LOCATIONS OF THE PRINCIPAL WORKS OF THE MOST FAMOUS SCULPTORS

(As the following lists are intended to aid such travellers as have a lively interest in Italian sculpture rather than to assist the earnest student of archæology, they do not pretend to absolute completeness, nor to finality of attribution.)

AMADEO OR OMADEO

Period of Productivity, 1466–1519.

Works :

PAVIA. — Certosa : Tomb of Visconti, by Amadeo and Pellegrini ; Portal of the Chiostro Piccolo, by Amadeo and the Mantegazza. S. Lanfranco : Tomb of S. Lanfranco. BERGAMO. — S. Maria Maggiore : Façade and Portal of Colleoni Chapel ; Tomb of Medea Colleoni ; Tomb of Colleoni. ISOLA BELLA. — Borromei Tombs.

AMMANNATI

Period of Productivity, 1540–1571.

Works :

FLORENCE. — Piazza Signoria : Fountain. PADUA. — Eremitani : Tomb Benevides. VILLA DI CASTELLO, near FLORENCE. — Hercules and Antæus (?) ; Colossal Statue of the Apennines (?).

BANDINELLI

Period of Productivity, 1512-1555.

Works :

FLORENCE.—Duomo : St. Peter. Opera del Duomo : Parts of Choir Rail and High Altar. Piazza Signoria : Hercules and Cacus. Palazzo Vecchio : Portrait Statues. Bargello : Adam and Eve ; Bronze Statuettes. Piazza S. Lorenzo : Monument of G. delle Bande Nere. Santa Croce : The Dead Christ ; God the Father. Annunziata : Pietà. Palazzo Pitti : Bacchus. ROME.—Santa Maria sopra Minerva : Tombs of Leo X and Clement VII. LORETO.—Bas-relief.

GIOVANNI DA BOLOGNA

References.—DESJARDINS, *La Vie et l'Œuvre de Jean Bologna* ; ROSENBERG, in *Dohme Series*.

Period of Productivity, 1559-1608.

Works :

FLORENCE.—Bargello : Mercury ; Virtue Conquering Vice ; Various Statuettes. Loggia de' Lanzi : Rape of the Sabines ; Hercules and Nessus. Piazza Signoria : Equestrian Statue of Cosimo I. A Dictionary of Architecture and Building

BIOGRAPHICAL, HISTORICAL, AND DESCRIPTIVE

By **RUSSELL STURGIS, A.M., Ph.D.**

Fellow of the American Institute of Architects

And many Architects, Painters, Engineers, and Other Expert Writers,
American and Foreign

In Three Quarto Volumes, Fully Illustrated

Cloth, \$18.00 net. Half Morocco, \$30.00 net

"Ambitious in scope and ample in bulk, the present work bids for wide acceptance among the general as well as the technical public. It is practically the only considerable effort to supply encroaching demands for a compendium which shall be at once convenient as to form and complete in the matter of contents. The aim of its compilers has evidently been to strike an average between that which is popular and that which is for the specialist, and in this they have shown sagacity. Edited under the direct supervision of Mr. Russell Sturgis, — who has contributed a momentous proportion of the material, — the work has enlisted the services of some sixty current authorities." — *Critic*.

"The first volume of the new 'Dictionary of Architecture and Building' which the Macmillan Company have had in preparation for many months has at last been issued, and, as far as can be judged from a preliminary inspection, ought to receive a cordial welcome from the many architects, painters, engineers, and others who will often have occasion to consult its pages. A special feature of this valuable reference book is the exhaustive treatment accorded the existing architecture of the separate countries. The present volume contains lengthy papers on Austria-Hungary, Belgium, and England, the latter occupying more than twenty-five quarto pages, and illustrated with numerous full-page reproductions of famous buildings. Special treatment is also promised for the countries of the far East. . . . A commendable feature is the addition to the vocabulary of names of important buildings, in cases where they have acquired special titles in addition to their geographical designation, such as Westminster Abbey, Bow Church, and the Pantheon, and the like, thus facilitating ready reference. A word of praise should be added for the illustrations, which are generous in number and show a wise discrimination in selection."

— *New York Commercial Advertiser*.

EUROPEAN ARCHITECTURE

A Historical Study

By **RUSSELL STURGIS, A.M., Ph.D.**

Fellow of the American Institute of Architects

Cloth, 8vo. Illustrated. \$4.00

"In Mr. Sturgis's 'European Architecture' rare good taste, simple truth, and great knowledge combine to satisfy eye and mind." — *The Independent*.

THE MACMILLAN COMPANY,

66 FIFTH AVENUE, NEW YORK

A HANDBOOK OF GREEK SCULPTURE

By **ERNEST ARTHUR GARDNER, M.A.**

Late Fellow of Gonville and Caius College, Cambridge, and formerly Director of the
British School of Archæology at Athens

With Fifty-five Illustrations

Cloth. 12mo. \$2.50 net

Buffalo Express: "There can be no question of the value of Mr. Gardner's book. It furnishes a general outline of our present knowledge of Greek sculpture, distinguishing the different schools and periods, and giving typical instances to show the development of each. It is, to use Mr. Gardner's own words, 'a framework into which the student can easily fit all the knowledge he may acquire from subsequent reading or observation.' The text is crowded with fact, but none the less clear."

A HISTORY OF GREEK ART

With an Introductory Chapter on Art in Egypt and
Mesopotamia

By **F. B. TARBELL,**

Professor of Classical Archæology in the University of Chicago

Profusely Illustrated

Cloth. 12mo. \$1.00 net

ROMAN AND MEDIEVAL ART

By **W. H. GOODYEAR, M.A.**

Author of "Renaissance and Modern Art," etc.

Revised and Enlarged, with many New Illustrations

Cloth. 12mo. \$1.00 net

RENAISSANCE AND MODERN ART

By **W. H. GOODYEAR, M.A.**

Author of "Roman and Medieval Art," etc.

With Many Illustrations

Cloth. 12mo. \$1.00 net

THE MACMILLAN COMPANY,

66 FIFTH AVENUE, NEW YORK
